# Radial Oil Seal

## ■ RADIAL OIL SEAL

### ■ The Seal

#### General

Rotary shaft lip seals are components designed in a ring form, fitted between machine parts in relative rotation, with the function of separating oil or grease from the inside and dirt, dust, water etc. from the outside.

The rotary shaft seals are generally composed of an elastomeric diaphragm, shaped in a "lip form" and reinforced with a co-vulcanized metal insert. The sealing lip is energized with a "Garter Spring".

#### Seal design

The sealing lip design corresponds to the current state of art and is based on many years of experience in a wide range of application fields.

The sealing edge can either be ready molded or trimmed by mechanical cutting.

The total radial force of the sealing lip is given by elastomer pre-tension together with tensile spring force. The former depends on the deformation and elasticity of the rubber material, geometry of the sealing lip and interference between shaft and seal.

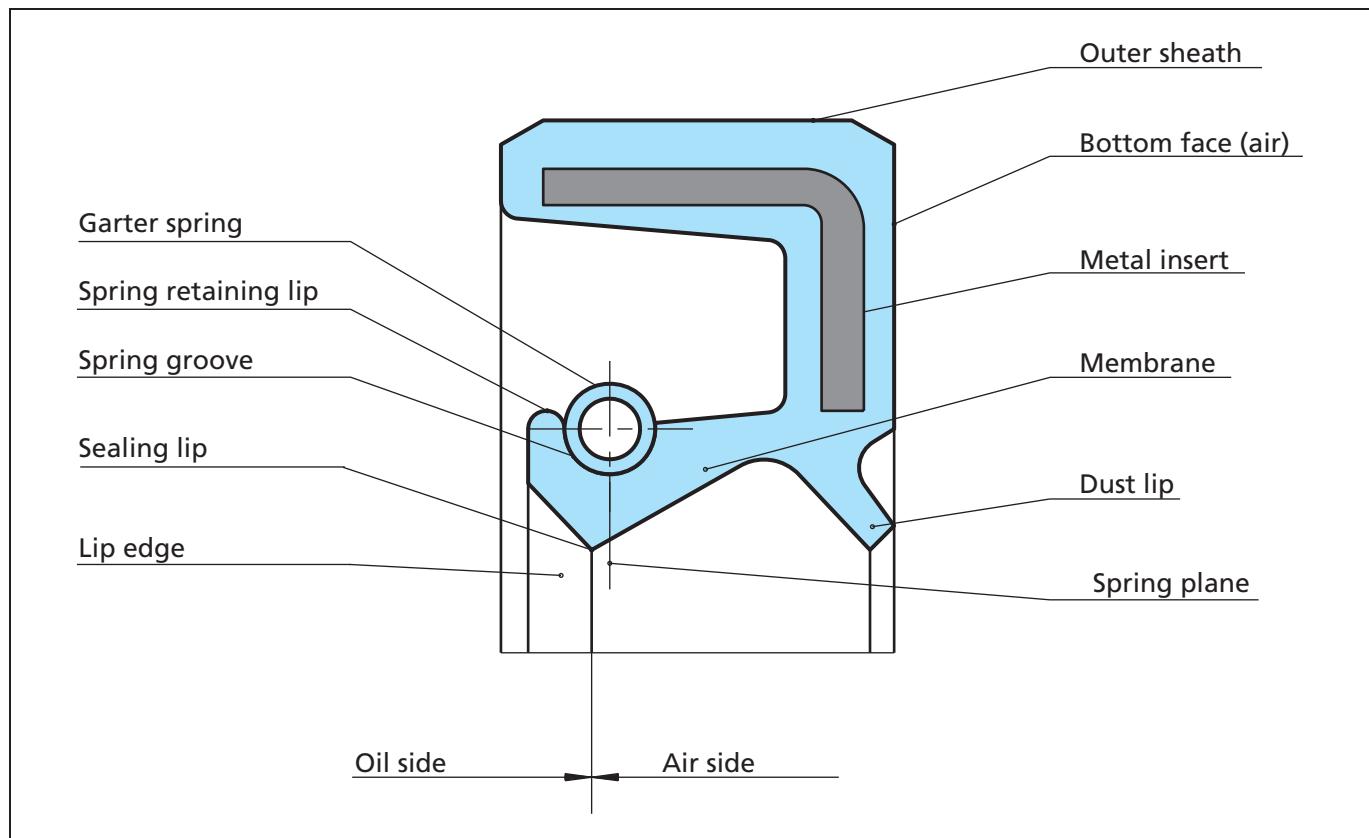

Figure 1 Designation for Rotary shaft lip seals (extract from ISO 6194)

# Radial Oil Seal

## Seal design

### Outer sheath

Can be either flat or wavy, fitting in both cases into ISO H8 bore and the tolerance of the outer sheath is according ISO 6194-1.

### Metal insert

Is normally made of cold rolled steel sheet AISI 1008, DIN 1624. Environmental conditions may require another material, such as stainless steel AISI 304, DIN 1.4301.

If the seal is not rubber covered as for the seal type TRC, TRD, TRB and TRF, the metal insert O.D. tolerance is also according ISO 6194-1. On request the O.D. can be delivered with sealing agent.

The case is normally made of cold rolled steel sheet AISI 1008, DIN 1624. Environmental conditions may dictate other materials, such as brass or stainless steel AISI 304, DIN 1.4301.

### Garter spring

#### Function

When rubber is exposed to heat, load or chemical action, it will gradually lose its original properties. The rubber is then said to have aged. The original radial force exerted by the sealing element will then diminish. The function of the garter spring is therefore to maintain the radial force.

Experiments have shown that the radial force must vary with the size and type of seal. Experiments have also clearly indicated the significance of maintaining changes in the radial force within narrow limits during the service life of the seal. Extensive investigations in the laboratory have formed the basis for defining the radial force.

The garter spring is closely wound and carries an initial tension. The total force exerted by the spring consists of the force required to overcome the initial tension and the force due to the spring rate. The use of a garter spring with initial tension provides the following advantages:

- as the sealing element wears, the total radial force from the initial tension will not change.
- by eliminating some of the initial tension by heat treatment, it can be adjusted to achieve the required radial force for the actual shaft diameter.
- the heat treatment of the spring takes place at a temperature above the operating thermal level of the seal, thus ensuring that the spring force will be stabilized. This procedure eliminates the risk that the original spring force will change during service.

### Material

Spring steel SAE 1074, DIN 17223 is normally employed. If resistance to corrosion is required stainless steel AISI 304, DIN 1.4301 is used. Garter springs of bronze or similar materials are not recommended, since they tend to fatigue after long service life or as a result of exposure to high temperatures. In special cases the garter spring can be protected against fouling by means of a thin rubber hose.

**Table I Tolerance according ISO 6194-1**

Nominal outside diameter	Diametral tolerance	
$d_2$	Metal cased	Rubber covered
$D_2 \leq 50$	+ 0.20	+ 0.30
	+ 0.08	+ 0.15
$50 < D_2 \leq 80$	+ 0.23	+ 0.35
	+ 0.09	+ 0.20
$80 < D_2 \leq 120$	+ 0.25	+ 0.35
	+ 0.10	+ 0.20
$120 < D_2 \leq 180$	+ 0.28	+ 0.45
	+ 0.12	+ 0.25
$180 < D_2 \leq 300$	+ 0.35	+ 0.45
	+ 0.15	+ 0.25
$300 < D_2 \leq 530$	+ 0.45	+ 0.55
	+ 0.20	+ 0.30

## ■ Design instruction Shaft

### Shaft

#### Surface finish, hardness and machining methods

The shaft design is of vital significance for the performance as well as for the useful life of the seal (see Figure 4). As a basic principle, the hardness of the shaft should be higher as peripheral speeds increase. The Standard DIN 3760 specifies that the shaft must be hardened at least 45 HRC.

As the peripheral speeds increase, the hardness must be increased and at 10 m/s a hardness of 60 HRC is required. The choice of a suitable hardness is dependent not only on the peripheral speed but also on such factors as lubrication and the presence of abrasive particles. Poor lubrication and difficult environmental conditions require a higher hardness of the shaft. DIN 3760 specifies a surface roughness of  $R_t=1 \mu\text{m}$  to  $4 \mu\text{m}$ . Laboratory tests have however proved that the most suitable roughness is  $R_t=2 \mu\text{m}$  ( $R_a=0.3 \mu\text{m}$ ). Rougher as well as smoother surfaces generate higher friction, resulting in increased temperature and wear. We suggest a surface roughness of  $R_t=2-3 \mu\text{m}$  ( $R_a=0.2-0.8 \mu\text{m}$ ).

Measurements of friction and temperature have also shown that grinding of the shaft is the best method of machining. However spiral grinding marks may cause a pumping effect and leakage and plunge grinding should therefore be applied, during which even ratios between grinding wheel speed and work-piece should be avoided. Polishing of the shaft surface with polishing cloth produces a surface which causes higher friction and heat generated as compared with plunge grinding. In certain cases it maybe impossible to provide the necessary hardness, surface finish and corrosion resistance of the shaft. This problem can be solved by fitting a separate sleeve onto the shaft. If wear should occur, only the sleeve need to be replaced (see the chapter "Shaft Repair Kit").

### Shaft run out

Shaft run out should as far as possible be avoided or kept within a minimum. At higher speeds there is a risk that the inertia of the sealing lip prevents it from following the shaft movement. The seal must be located next to the bearing and the bearing play be maintained at the minimum value possible. See Figure 2.

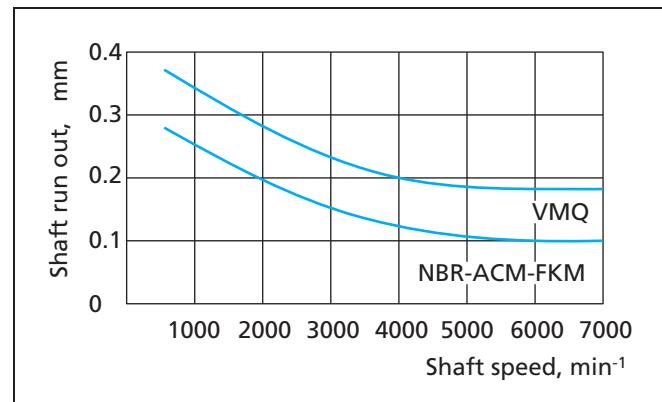

Figure 2 Shaft run out

### Eccentricity

Eccentricity between shaft and housing bore centers should be avoided in order to eliminate unilateral load of the lip. See Figure 3.

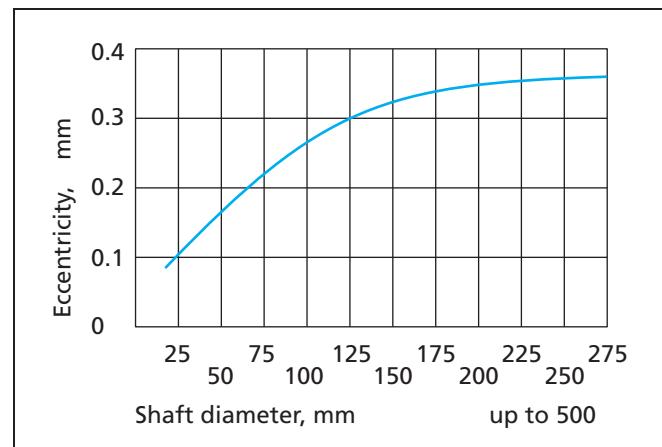

Figure 3 Eccentricity

# Radial Oil Seal

## Design instruction Shaft

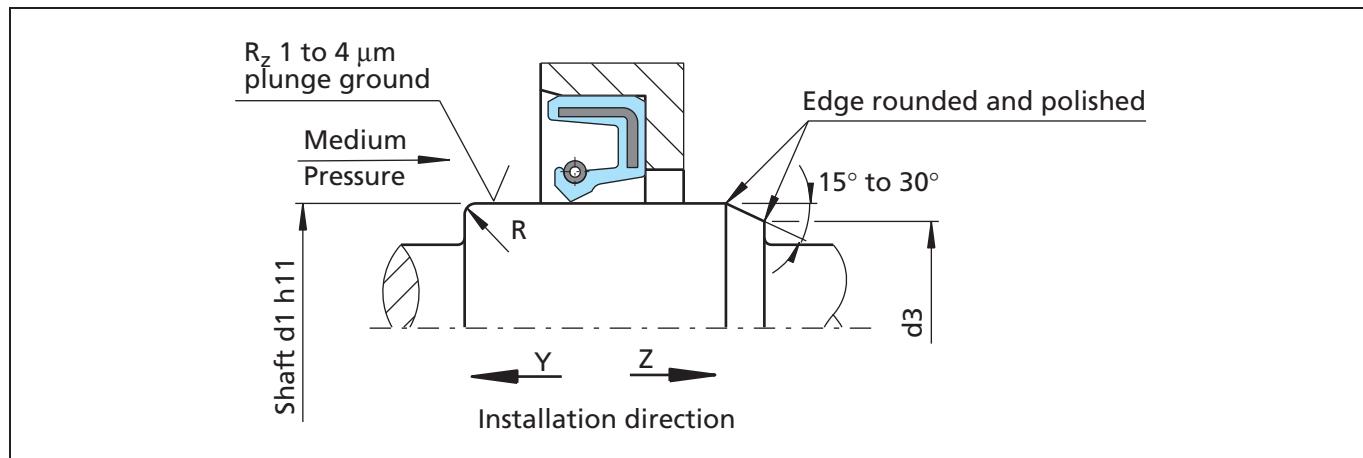

Figure 4 Installation of the Radial Oil Seal

Depending on the installation direction (Y or Z), a chamfer or radius on the shaft is recommended. The dimensions for this are shown in Figure 4 and Table II.

**Table II Chamfer length for shaft end**

<b>d<sub>1</sub></b>	<b>d<sub>3</sub></b>	<b>R</b>
< 10	d <sub>1</sub> - 1.5	2
over 10 to 20	d <sub>1</sub> - 2.0	2
over 20 to 30	d <sub>1</sub> - 2.5	3
over 30 to 40	d <sub>1</sub> - 3.0	3
over 40 to 50	d <sub>1</sub> - 3.5	4
over 50 to 70	d <sub>1</sub> - 4.0	4
over 70 to 95	d <sub>1</sub> - 4.5	5
over 95 to 130	d <sub>1</sub> - 5.5	6
over 130 to 240	d <sub>1</sub> - 7.0	8
over 240 to 500	d <sub>1</sub> - 11.0	12

## Characteristics of the shaft surface

The running surface for oil seals is specified in DIN 3760/61. The surface should meet the following requirements:

Surface roughness	R <sub>a</sub> = 0.2 to 0.8 μm
	R <sub>z</sub> = 1 to 4 μm
	R <sub>max</sub> = 6.3 μm

Hardness                    55 HRC or 600 HV,  
                                  hardness depth min. 0.3 mm

## Surface roughness

The functional reliability and service life of a seal depends to a very great extent on the quality and surface finish of the mating surface to be sealed. Scores, scratches, pores, concentric or spiral machining marks are not permitted. Higher demands must be made on the surface finish of dynamic mating surfaces than to static mating surfaces.

The characteristics most frequently used to describe the surface microfinish, R<sub>a</sub>, R<sub>z</sub> and R<sub>max</sub>, are defined in ISO 4287. These characteristics alone, however, are not sufficient for assessing the suitability in seal engineering. In addition, the material contact area R<sub>mr</sub> in accordance with ISO 4287 should be considered. The significance of these surface specifications is illustrated in Figure 5. It shows clearly that specification of R<sub>a</sub> or R<sub>z</sub> alone does not describe the profile form accurately enough and is thus not sufficient for assessing suitability in seal engineering.

The material contact area R<sub>mr</sub> is essential for assessing surfaces, as this parameter is determined by the specific profile form. This in term is directly depending on the machining process employed.

Surface profile	R <sub>a</sub>	R <sub>z</sub>	R <sub>mr</sub>
closed profile form 	0.1	1.0	70%
open profile form 	0.2	1.0	15%

Figure 5 Profile forms of surfaces

## Design instruction Housing bore

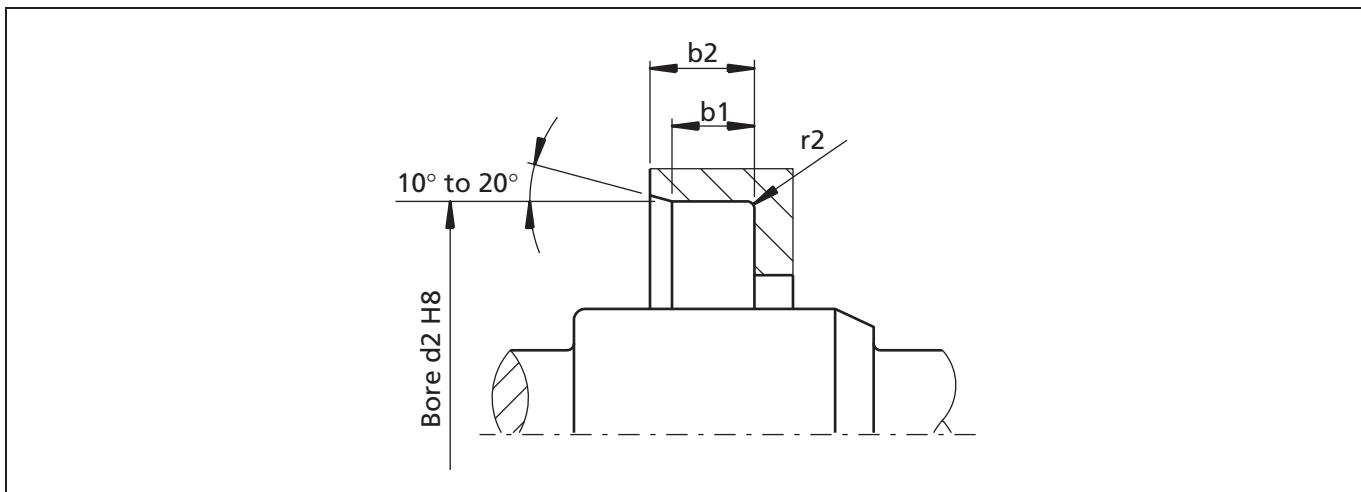

Figure 6 Installation depth and lead-in chamfer

### Housing bore

For metric sizes the tolerances are in accordance with the German Standard DIN 3760 which provides a suitable press fit for the bore tolerance ISO H8. The inch sizes are in accordance with American Standards. In cases where the housing bore has a different tolerance the seal can be made to a suitable size. For bearing housings made of soft materials, e.g. light metals, and for bearing housings with thin walls, a special fit between the seal and the housing may be necessary. The tolerances for the seal and housing should then be determined by practical assembly trials. If a component such as a bearing is assembled through the housing bore for the seal, the bore may be damaged. In order to avoid damaging the bore, a seal with a larger outside diameter than that of the bearing should be selected.

### Surface roughness of the housing

Values for the surface roughness in the gland are specified in ISO 6194/1.

General values:

$R_a$	=	1.6	-	6.3	$\mu\text{m}$
$R_z$	=	10	-	20	$\mu\text{m}$
$R_{\max.}$	=	16	-	25	$\mu\text{m}$

For metal/metal sealing or gas sealing, a good score-free and spiral-free surface finish is necessary. If the rotary shaft lip seal is bonded into the housing, ensure that no adhesive comes into contact with the sealing lip or the shaft.

Table III Housing dimensions

Ring Width b	$b_1$ ( $0.85 \times b$ ) mm	$b_2$ ( $b + 0.3$ ) mm	$r_2$ max.
7	5.95	7.3	0.5
8	6.80	8.3	
10	8.50	10.3	
12	10.30	12.3	0.7
15	12.75	15.3	
20	17.00	20.3	

## Radial Oil Seal

### Installation instructions

The following points must be observed when installing rotary shaft lip seals:

- Before installing, clean the installation grooves. Shaft and seal must be greased or oiled for rubber seals
- Sharp-edged transitions must either be chamfered or rounded or else covered
- When pressing in the seal, take care that the seal ring is not twisted
- The pressing force must be applied as close as possible to the outer circumference of the seal
- After installation, the seal must be concentric and at right angles to the shaft
- The end face of the mounting bore is generally used as the contact surface; the seal can also be fixed with a shoulder or a spacer washer.

Figure 7 shows various force fit situations of the rotary shaft lip seal with suitable installation tools or devices.

### Dismantling and replacement

The dismantling of seals does not normally present any problems. A screwdriver or similar tool can generally be used. The seal will then be deformed. After repair or maintenance of a machine a new rotary shaft lip seal must always be installed, even if the old ones seem to be still usable. The sealing edge of the new seal must not ride on the old contact area on the shaft. This can be achieved by:

- replacement of shaft sleeves
- fitting the seal into the bore to a different depth
- rework of the shaft and assemble a wear sleeve (see the chapter "Shaft Repair Kit").

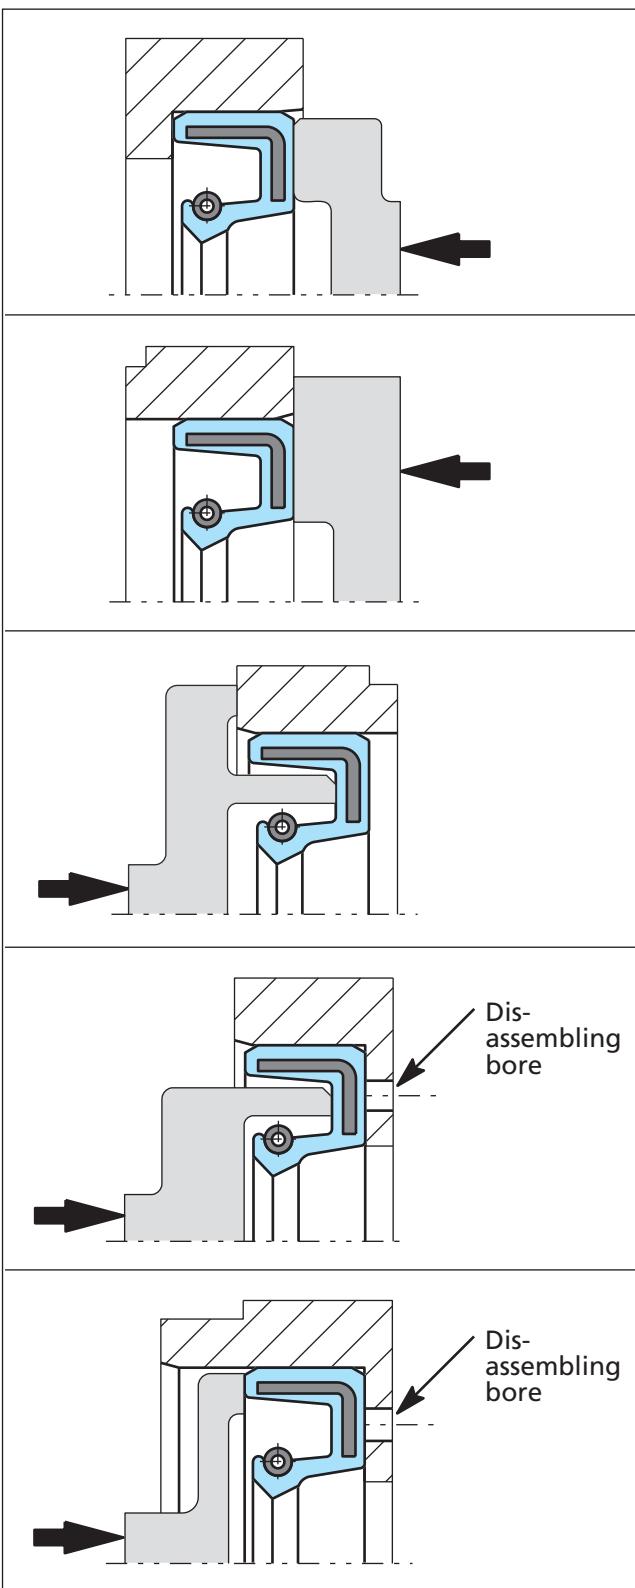

Figure 7 Installation aids for fitting rotary shaft lip seals

# Radial Oil Seal

## Sealing element

### Compound

The material selected must take into account environmental conditions and function requirements.

Some of the requirements associated with environmental considerations are:

- Good chemical resistance
- Good resistance to heat and low temperature
- Good resistance to ozone and weathering

The functional demands include:

- High resistance to wear
- Low friction
- Low compression set
- Good elasticity

In addition, cost considerations render ease of processing a desirable feature. Trelleborg Sealing Solutions can supply the optimum material for each application.

To identify this contact your local Trelleborg Sealing Solutions marketing company.

### Type and designations of materials

Nitrile rubber	(NBR)
Acrylic rubber	(ACM)
Silicone rubber	(VMQ)
Fluorinated rubber	(FKM)
Hydrogenated Nitrile rubber	(HNBR)

A further development of the Nitrile rubber has led to the so called hydrogenated Nitrile rubber (HNBR). The heat and ozone resistance is significantly better. This material can replace Acrylic rubber and in certain cases also Fluorinated rubber. In order to satisfy the wide range of demands made on seals, a special composition has been developed for each type of rubber. Other compositions are also available to meet some extreme requirements.

**Table IV Material recommendations**

Materials for sealing common media		Material designation					
		Acrylonitrile Butadiene Rubber NBR	Fluorocarbon Rubber FKM	Polyacrylate Rubber ACM	Silicone Rubber VMQ	Hydrogenated Acrylonitrile Butadiene Rubber HNBR	
		Material Abbreviation					
Mineral fluids	N	V	A	S	H		
	Engine oils	100	170	125	150	130	
	Transmission oils	80	150	125	130	110	
	Hypoid transmission oils	80	150	125	--	110	
	ATF oils	100	170	125	--	130	
	Hydraulic fluids (DIN 51524)	90	150	120	--	130	
Flame retardant hydraulic fluids (VDMA 24317) (VDMA 24320)	Greases	90	--	--	--	100	
	Oil-water emulsion	70	--	--	60	70	
	Water-oil emulsion	70	--	--	60	70	
	Aqueous solutions	70	--	--	--	70	
Other media	Water-free fluids	--	150	--	--	--	
	Fuel oils	90	--	--	--	100	
	Water	90	100	--	--	100	
	Lyes	90	100	--	--	100	
	Air	100	200	150	200	130	

Due to the different configurations of the media, the above-mentioned temperature ranges are for guidance only. Depending on the medium, significant deviations may occur.

# Radial Oil Seal

## Description of rubber materials

### Nitrile Rubber (NBR)

Advantages:

- Good oil resistance
- Good heat resistance up to 100°C in oil
- High tensile strength (special compounds over 20 MPa)
- High elongation at break
- Low swelling in water

Limitations:

- Poor weather and ozone resistance
- Poor resistance against polar fluids (ester, ether, ketones and aniline)
- Poor resistance against chlorinated hydrocarbons (carbon tetrachloride, trichlorethylene)
- Poor resistance against aromatic fluids (e.g. benzene, toluene)

Fluids, mineral oils and above all high-alloyed mineral oils (hypoid oils) containing larger quantities of aromatic hydrocarbons have a high swelling effect on NBR-compounds. The swelling behavior can be improved by increasing the acrylonitrile content.

However an inferior cold flexibility and resistance to compression set must be accepted. The additives in high-alloyed oils can in certain cases cause an additional interaction between the elastomer and the additive, thus influencing the elasticity.

### Hydrogenated Nitrile Rubber (HNBR)

Advantages:

- Good oil resistance, also in hypoid oils
- Good heat resistance, up to + 150 °C
- Good mechanical properties
- Good weather and ozone resistance

Limitations:

- Poor resistance against polar fluids (esters, ethers, ketones and aniline)
- Poor resistance against chlorinated hydrocarbons (carbon tetrachloride, trichlorethylene)
- Poor resistance against aromatic fluids (bensene, toluene)

### Polyacrylic Rubber (ACM)

Advantages:

- Good resistance against oils and fuels (better than Nitrile rubber)
- Heat resistance about 50 °C better than for Nitrile rubber, 150 °C in oil and 125 °C in air
- Good weather and ozone resistance

Limitations:

- Not usable in contact with water and water solutions, even smaller quantities of water in oil
- Limited cold flexibility to about -20 °C, somewhat poorer than normal NBR
- Limited tensile strength and tear resistance, especially above 100 °C
- Poor wear resistance (considerably inferior compared to NBR)
- Poor resistance against polar and aromatic fluids and chlorinated hydrocarbons

## Fluorinated Rubber (FKM)

Advantages:

- The resistance against oils and fuels is better than for any other rubber type
- The only highly elastic rubber material, which is resistant to aromatic and chlorinated hydrocarbons
- Excellent heat resistance, the best one after silicone rubber, up to 200°C
- Excellent weather and ozone resistance
- Excellent acid resistance (only inorganic acids, not suitable for organic acids e.g. acetic acid)

Limitations:

- Limited cold flexibility, to approx.-20°C to -25°C
- Limited tensile and tear strength, especially above 100°C
- High compression set in hot water
- Poor resistance to polar solvents

## Silicone Rubber (VMQ)

Advantages:

- Best heat resistance of all rubber types
- Best cold resistance of all rubber types
- Excellent weather and ozone resistance
- Resistant against aliphatic mineral oils and most grease types

Limitations:

- Poor tensile and tear strength for standard compounds
- Poor wear resistance
- Poor resistance against aromatic oils and oxidized mineral oils
- Poor diffusion resistance

# Radial Oil Seal

## Working parameters

### Temperature resistance

Increasing temperature accelerates the aging of the rubber, the material becomes hard and brittle, the elongation decreases and the compression set increases. Axial cracks at the sealing edge are a typical indication that the seal has been exposed to excessively high temperature.

The aging of the rubber has appreciable significance on the useful life of the seal. The temperature limits for the principal materials are illustrated in Figure 8. They should only be regarded as approximate, since the materials are also affected by contact media. It can generally be said that a temperature increase of 10°C (in air) will halve the theoretical useful life of the rubber.

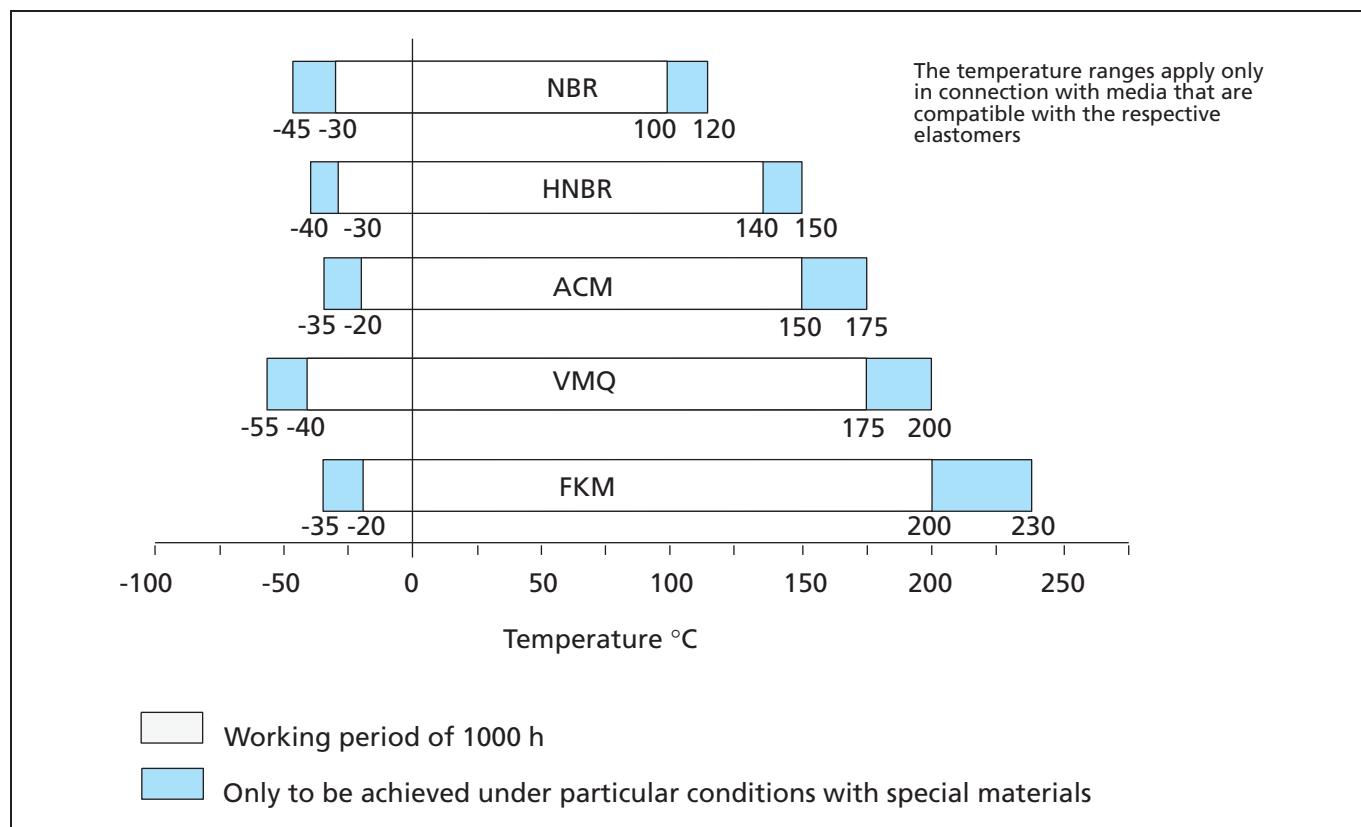

Figure 8 Temperature limits for some common types of rubber

### Temperature

Temperature is the most critical criteria to be considered when selecting a rotary seal.

The temperature limits indicated in the selection tables are maximum operating temperatures of the sealing material in fluids to which the sealing material is compatible (good chemical resistance and controlled swelling/shrinkage).

The above descriptions show that the temperature in the sealing area is influenced by various parameters especially:

- The lubricating capability of the fluid and its ability to dissipate the heat generated under the sealing lip.
- The circumferential velocity
- The pressure applied

The resulting temperature in the sealing area must be considered to select the appropriate material. The initial temperature of the fluid can increase by up to 50% depending on operating parameters. For all applications please refer to the recommendations in the various chapters and contact your local Trelleborg Sealing Solutions marketing company.

## Working parameters

### Overpressure

When the sealing element is exposed to pressure it is forced against the shaft and the area of the lip in contact with the shaft increases. The friction as well as the generated heat, increases. As a result, when the seal is under pressure, the specified values of peripheral speed cannot be maintained but must be reduced in relation to the magnitude of the pressure. At high peripheral speeds even overpressures of 0.01 to 0.02 MPa may cause difficulties. By fitting a separate back-up ring the types (TRA, TRC, TRB) can be used for overpressure above 0.05 MPa. The separate back-up ring shape follows the rear profile of the sealing element but without mutual contact when no pressure differential exists. See Figure 9. However, the back-up ring requires accurate fitting.

Please ask your local Trelleborg Sealing Solutions marketing company for suitable back-up ring drawing. Seal type TRU is formed to support the sealing element. See Figure 9. The type TRP/6CC is designed with a short and sturdy sealing lip, which allows overpressures without using a separate back-up ring. When a back-up ring is installed or when the types TRU, TRP/6CC are used, overpressures of 0.4 to 0.5 MPa are permissible at moderate peripheral speeds.

At very high pressures, the seals with rubber-covered cases should be employed in order to avoid leakage between the periphery of the seal and the housing bore. When the seal is under pressure there is a risk of axial movement in the housing bore (pop-out). This effect can be prevented by locating the seal against a shoulder, with a spacer ring or a circlip.

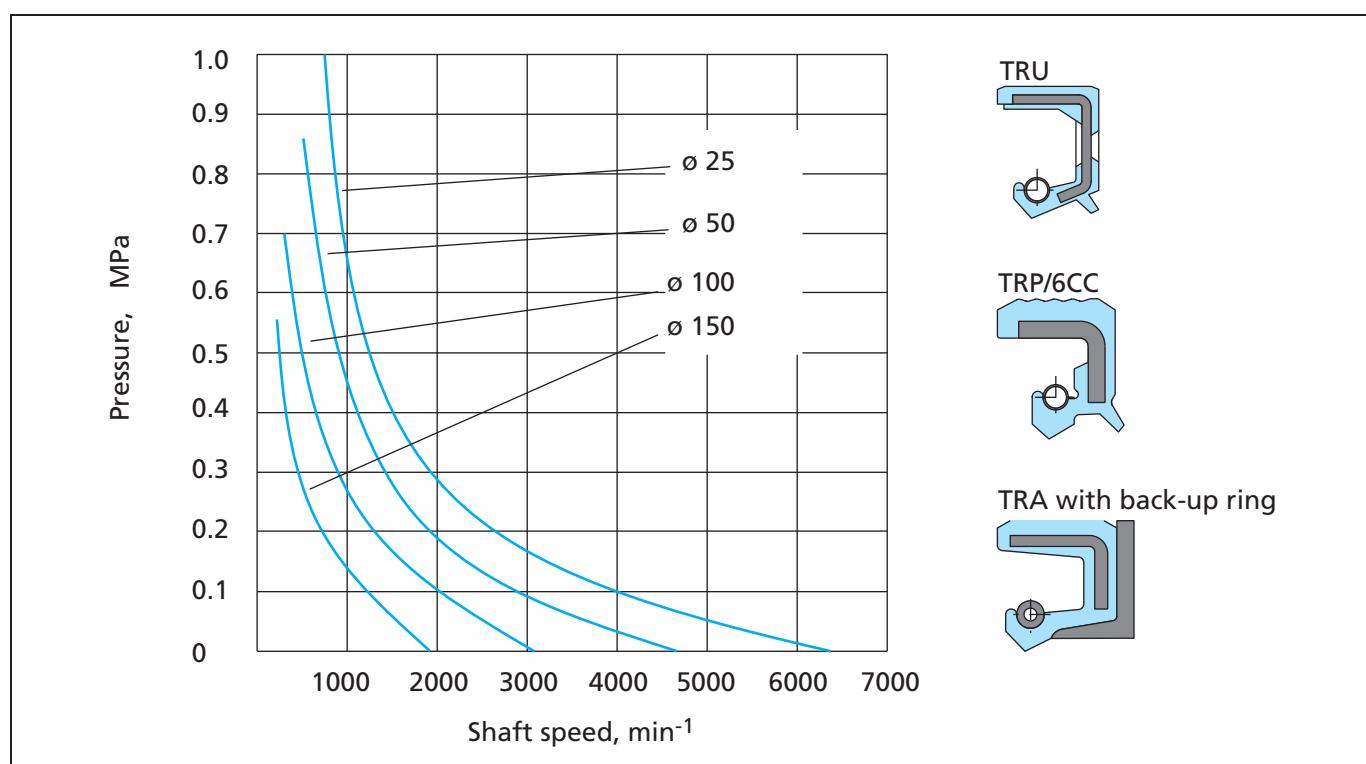

Figure 9 Permissible overpressure for supported lip seals and for pressure seals

# Radial Oil Seal

## Working parameters

### Peripheral speed and number of revolutions

Different designs of the sealing element affect the magnitude of the friction and thus result in varying temperature rises. Various designs of the sealing element allow different maximum peripheral speeds. Figure 10 shows the approximate maximum values for the permissible peripheral speed for sealing elements (without dust lip), i.e. seal type TRC, TRA, TRB, etc, made with materials NBR, ACM, FKM and VMQ, with no

differential pressure, and where adequate lubrication or cooling of the sealing edge by the sealed medium exists. In addition the maximum permissible operating temperatures shown in table IV must not be exceeded. The curve shows that higher peripheral speeds are permissible for larger shaft diameters more than for the smaller. This is due to the fact that the cross-sectional area increases in proportion to the square of the diameter, thus increasing the heat dissipation capacity.

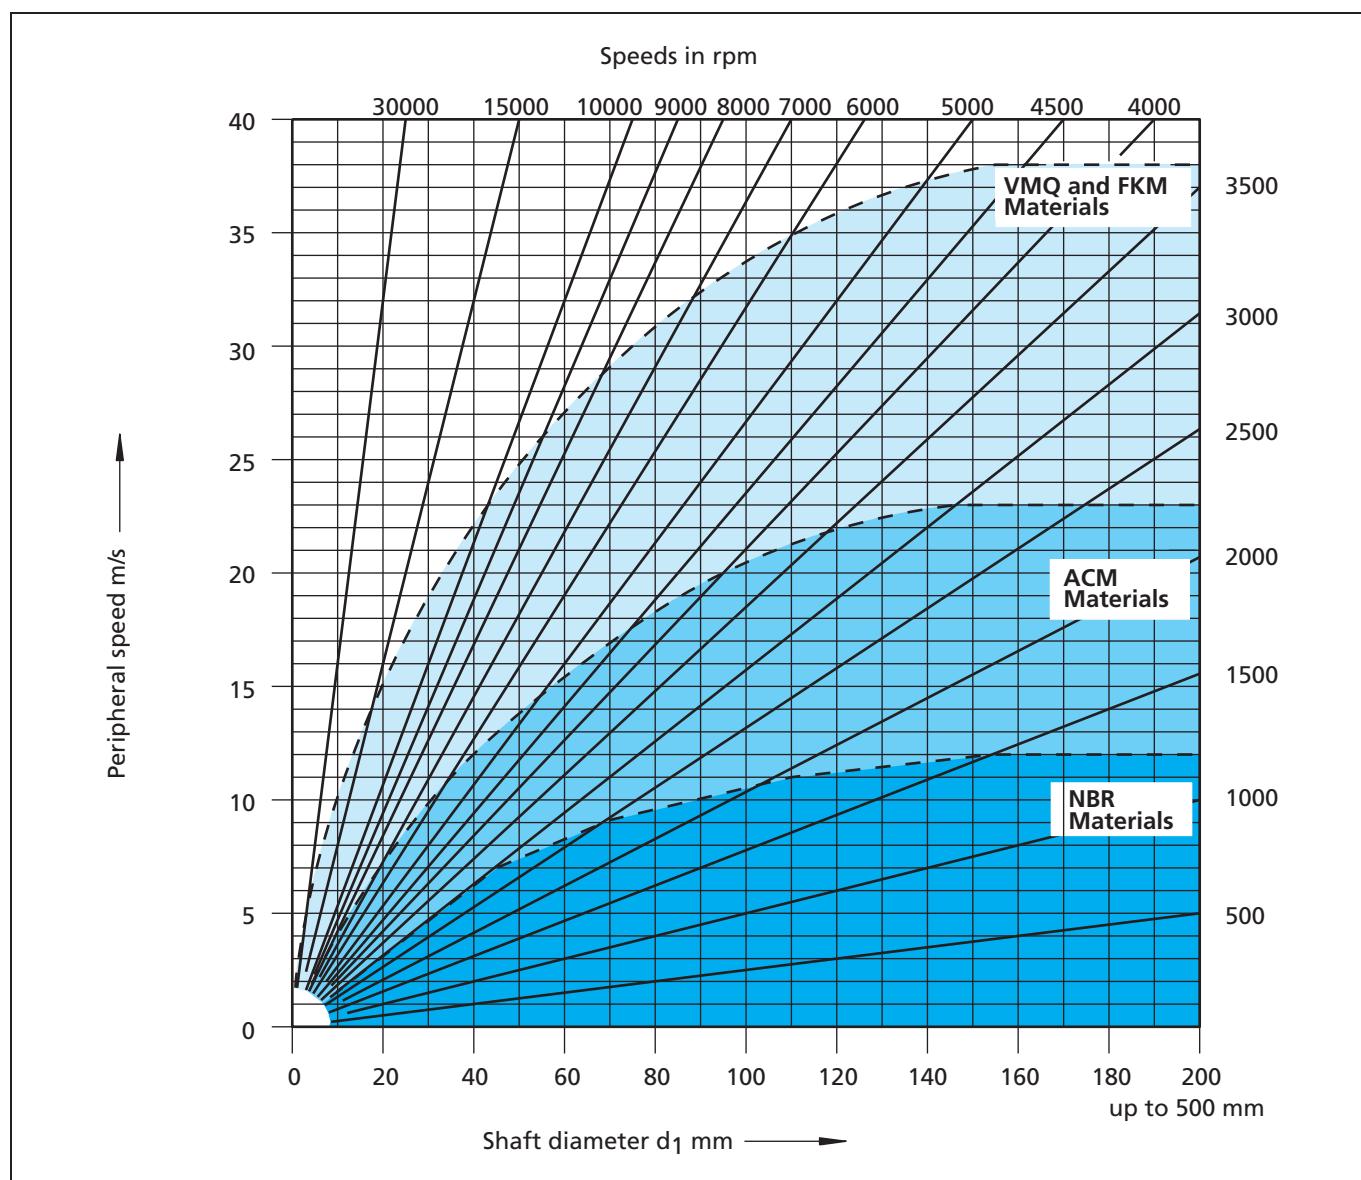

Figure 10 Permissible speeds in pressure-free state to DIN 3761

## Working parameters

### Frictional loss

The frictional loss is often of significant magnitude, particularly when low powers are transmitted. The frictional loss is affected by the following parameters: seal design and material, spring force, speed, temperature, medium, shaft design, and lubrication. Figure 11 shows the frictional losses in watts caused by a seal without dust lip when fitted in accordance with our technical instructions. In certain cases the frictional loss can be reduced by a special design of the sealing lip, reduction of the spring force or by employing a special grade of rubber. Our technical department will be pleased to provide advice on such matters. It should be noted that the frictional loss during the "running in" period is greater than shown in the figure. The normal "running in" period is a few hours.

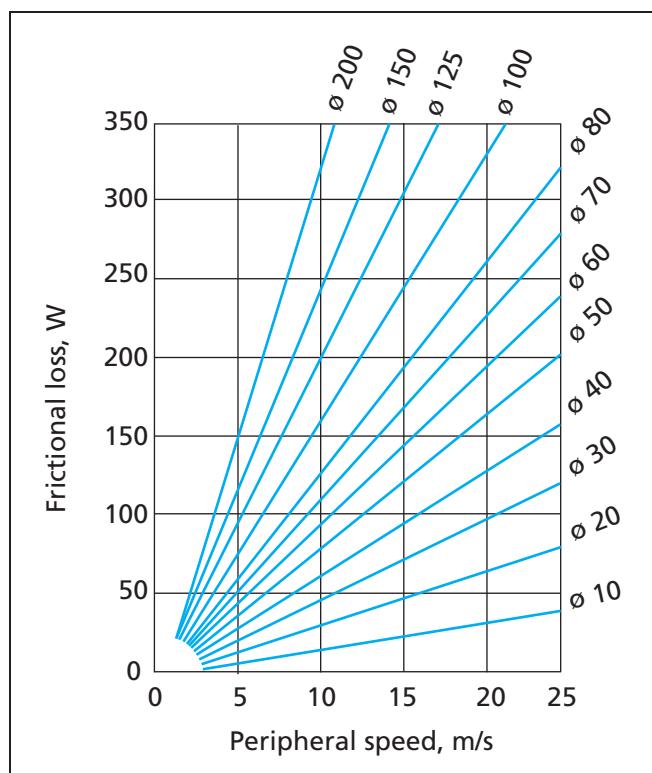

Figure 11 Frictional loss for TRA type seal of Nitrile rubber

### Leakage control

When defining leakage control one must differentiate between static sealing (sealing of two surfaces without motion relative to one another) and dynamic sealing (relative motion between the two surfaces).

With a moving seal surface, a fluid film separates the sliding surfaces from one another; a dynamic seal gap forms. Unlike in static sealing, the leakage path is not fully closed off, so small quantities may escape. Seals in which a dynamic seal gap forms between the seal body and a rotating shaft cannot be tight in the physical sense.

Absolute tightness in the physical sense cannot be achieved with a seal gap alone when sealing moving parts.

For many technical applications, however, it is quite adequate if the "leakage" is reduced to such an extent that there are no negative consequences for the environment or the operation of the assembly. This is called technical tightness.

Technical tightness must be specified by the user or manufacturer of an assembly, i.e. in some circumstances maximum permitted leakage rates must be defined.

For example, leakage classes are defined for oil seals in DIN 3761 Part II (Motor vehicles).

The German standard DIN 3761 classifies the tightness of lip seals into leakage classes 1 to 3. A so called zero-leakage is also defined. Zero-leakage means a function related film of moisture at the sealing edge to a non-drip formation of medium over the back-face of the seal. It is better to accept this "minimum leakage" rather than risking the lip to be damaged due to insufficient lubrication. The permissible leakage in class 1 to 3 is max 1 g to 3 g per seal for a test time of 240 hours.

## Radial Oil Seal

### Working parameters

#### Media

The media to be sealed influences heavily the choice of the seal and material type. Mainly liquid media need to be sealed in rotary applications. Pasty media generally restrict the use of rotary seals, especially in terms of circumferential velocity. Gaseous media require specially adapted seal designs.

#### Liquid media:

Most of the applications relate to lubricating fluids but also hydraulic fluids based on mineral oils acc. DIN 51524 or ISO 6743 or fire resistant hydraulic fluids as well as environmentally friendly hydraulic fluids. In specific application aggressive media with low lubricating capabilities must be sealed. Sealing of other fluids such as water or FDA compliant fluids require in many cases a special sealing solution and will not be covered in detail in this catalogue. For specific needs please contact your local Trelleborg Sealing Solutions marketing company. The media is the first criteria to be considered for the selection of the sealing material type. It will also influence the seal family and the profile.

The evaluation of the compatibility of the seal material with the media to be sealed is based on the analysis of the values of tensile strength, elongation, volume change and hardness change resulting from an immersion test of testing slabs. Please contact your local Trelleborg Sealing Solutions marketing company to select the optimum material for your application.

#### Mineral oils:

Mainly used in transmissions, elastomer materials have good compatibility with mineral oils within the recommended temperature range. Some mineral oils e.g. hypoid transmission oils contain special additives which produce more demanding operating conditions e.g. temperature range and/or high pressure. For these fields testing is recommended.

#### Synthetic oils:

For improvement of the viscosity, high temperature and/or service life, new oils with specific additives have been launched as partial or full synthetic oils. Elastomer sealing materials give the same good compatibility to synthetic mineral oils as they do to mineral oils. However, compatibility needs to be checked. .

#### Grease:

Often used for roller and plain bearings, this media requires special adaptation of the sealing solution. To reduce the risk of tilting the sealing lip and allow the sealing lip to open under increasing pressure, the seal is installed in the reverse direction. Another important parameter to be considered is the maximum circumferential velocity. The maximum speed must be reduced to 50% of the permitted speed in oil, due to the poor heat exchange the grease can provide.

Above this limit the change from grease to oil or installation of seal with PTFE based lip (Turcon® and other) should be considered.

#### Poor lubricating media:

For those media an initial lubrication of the seal is required to avoid dry running. In such applications we recommend the radial oil seal with dust lip. The area between the lips will be used as a lubricant reservoir. Two seals in tandem Radial oil seal/ Radial oil seal or Radial oil seal/GAMMA seal will provide the same result

#### Aggressive media:

Generally aggressive media (e.g. solvents) have poor lubricating properties and therefore we recommend Turcon® Varilip® or PDR seals. Turcon® and other PTFE materials solve the problem of chemical resistance and the metal cage can be produced out of various Stainless Steel materials.

## Environmentally-friendly hydraulic fluids (bio oils)

When machines or process equipment are hydraulically operated, escaping hydraulic oil can pollute surface waters and the ground. One way of minimizing the danger posed by unwanted leakage, is the use of biologically degradable, non toxic oils. In many countries, there are already statutory regulations and catalogs of requirements for dealing with materials that endanger water. Hydraulic and transmission fluids that protect the environment are already specified in some cases. Figure 12 shows the types of biodegradable fluids.

Environmentally-friendly fluids have application in all systems, which operate for example in mobile and agricultural machinery and in the water and forestry industries. In stationary systems, they are employed in plants where water is at risk, such as locks, water turbines and for foodstuffs and pharmaceutical products.

An important criterion for biologically rapidly degradable fluids is their compatibility with seals. In Table V the resistance of elastomeric materials are given to "bio-oils".

DIN 3761  
Type C

**TRF**

DIN 3761  
Type CS

Figure 13 Standard types

## ■ Trelleborg Sealing Solutions type TRA

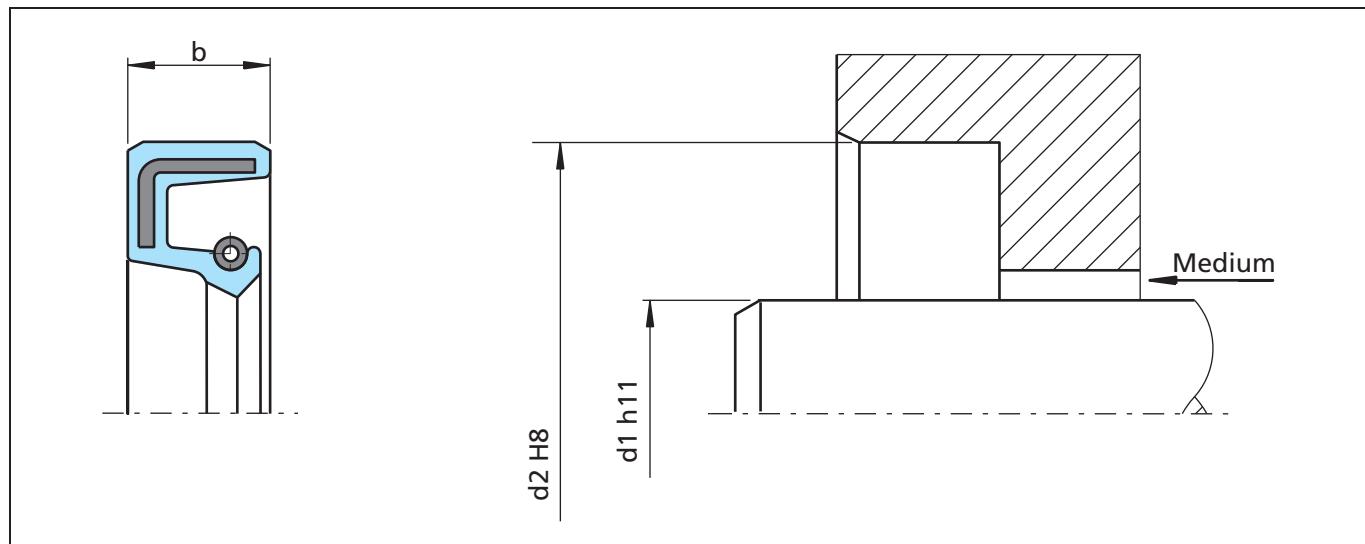

Figure 14 Installation drawing

### General description

Trelleborg Sealing Solutions type TRA are seals with completely rubber covered outer diameter. Two different O.D design are available: Flat rubber sheath as well as wavy.

This type is not recommended for use in heavily polluted environments.

### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Higher bore surface roughness is allowed
- Installation in split-housings
- Modern lip design provides low radial forces

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools

### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

**Table VI Materials**

Standard material*	TSS material code	Standard metal insert**	Standard spring**
NBR (70 Shore A)	N7MM	Carbon steel	Carbon steel
NBR (75 Shore A)	4N011		
FKM (70 Shore A)	VCBV	Carbon steel	Stainless steel
FKM (75 Shore A)	4V012		

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

**Ordering example oil seal TSS type**

TSS Type: A  
 Code: TRA

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRE

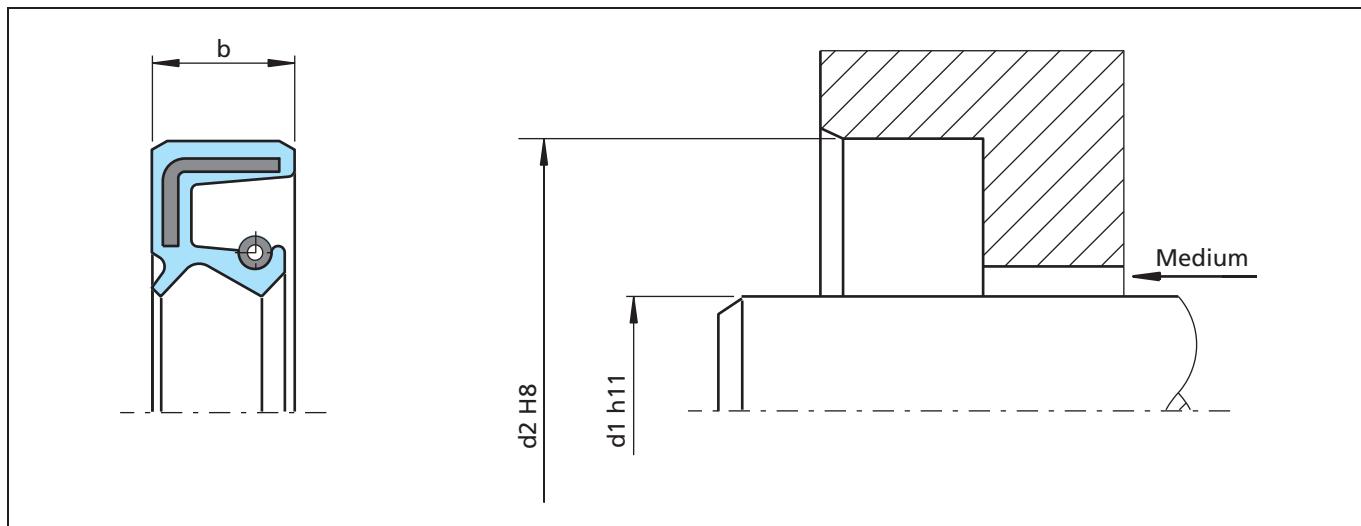

Figure 15 Installation drawing

#### General description

Trelleborg Sealing Solutions type TRE are seals with completely rubber covered outer diameter. Two different O.D. design are available: Flat rubber sheath as well as wavy. The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied.

#### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Effective protection against air side contaminants
- Higher bore surface roughness is allowed
- Installation in split-housings
- Modern lip design provides low radial forces

#### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools

#### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## ■ Trelleborg Sealing Solutions type TRC

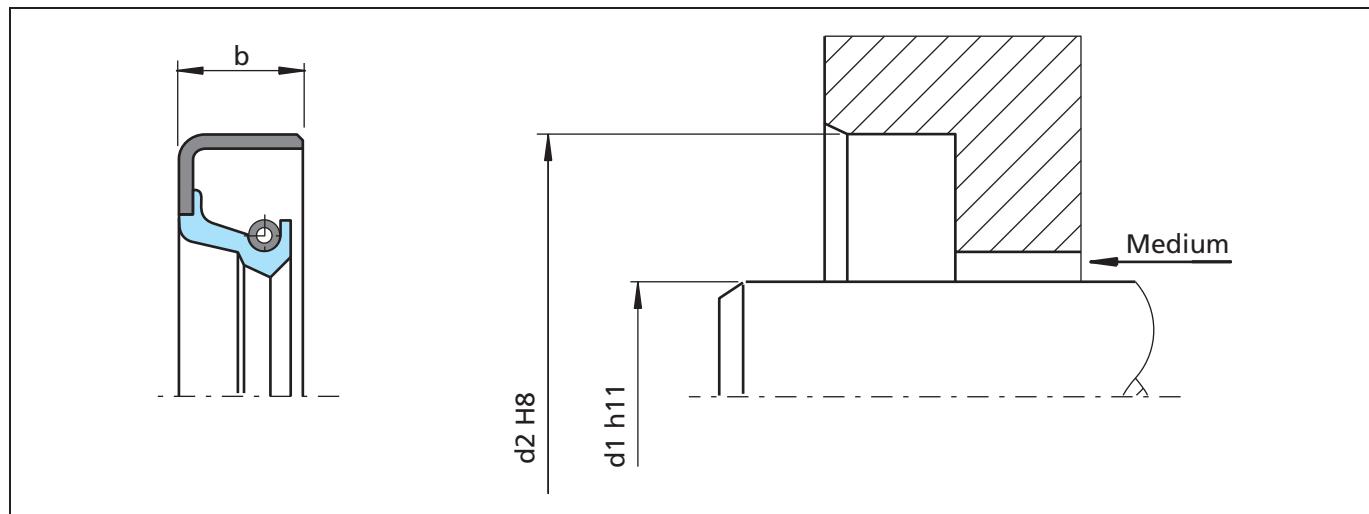

Figure 16 Installation drawing

### General description

Trelleborg Sealing Solutions type TRC are metal cased radial lip seals. This type is not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with Epoxy-based resin O.D. coating. This special treatment is on request.

### Advantages

- Good radial stiffness, especially for large diameters
- Good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications

### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

**Table X Materials**

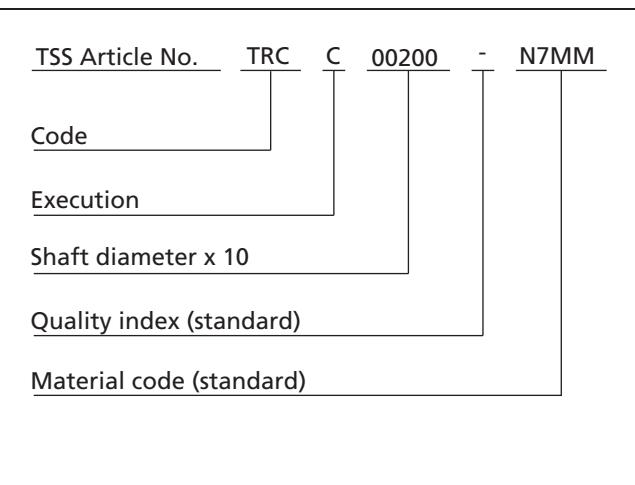

Standard material*	TSS material code	Standard metal insert**	Standard spring**
NBR (70 Shore A)	N7MM	Carbon steel	Carbon steel
NBR (75 Shore A)	4N011		
FKM (70 Shore A)	VCBV	Carbon steel	Stainless steel
FKM (75 Shore A)	4V012		

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

### Ordering example oil seal TSS type

TSS type: C  
 Code: TRC  
 Dimensions: Shaft diameter 20 mm  
 Housing diameter 35 mm  
 Width 7 mm  
 Material: NBR  
 Material Code: N7MM

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRD

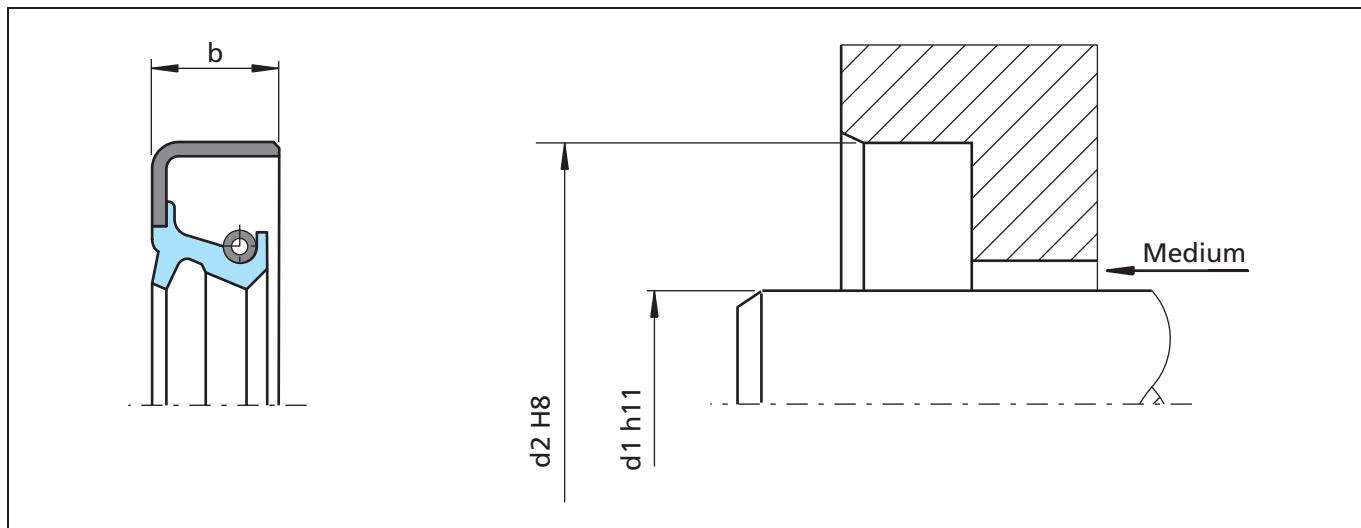

Figure 17 Installation drawing

#### General description

Trelleborg Sealing Solutions type TRD are metal cased radial lip seals. The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied. As the static sealing between housing and metallic shell is somewhat limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

#### Advantages

- Effective protection against air side contaminants
- Good radial stiffness, especially for large diameters
- Good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective

#### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications

#### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

# Radial Oil Seal

**Table XII Materials**

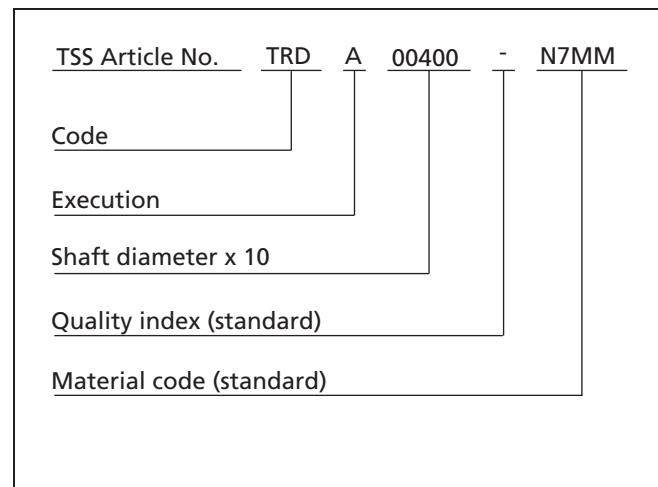

Standard material*	TSS material code	Standard metal insert**	Standard spring**
NBR (70 Shore A)	N7MM	Carbon steel	Carbon steel
NBR (75 Shore A)	4N011		
FKM (70 Shore A)	VCBV	Carbon steel	Stainless steel
FKM (75 Shore A)	4V012		

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

**Ordering example oil seal TSS type**

TSS type: D  
 Code: TRD  
 Dimensions: Shaft diameter 40 mm  
 Housing diameter 52 mm  
 Width 7 mm  
 Material: NBR  
 Material Code: N7MM

## ■ Trelleborg Sealing Solutions type TRB

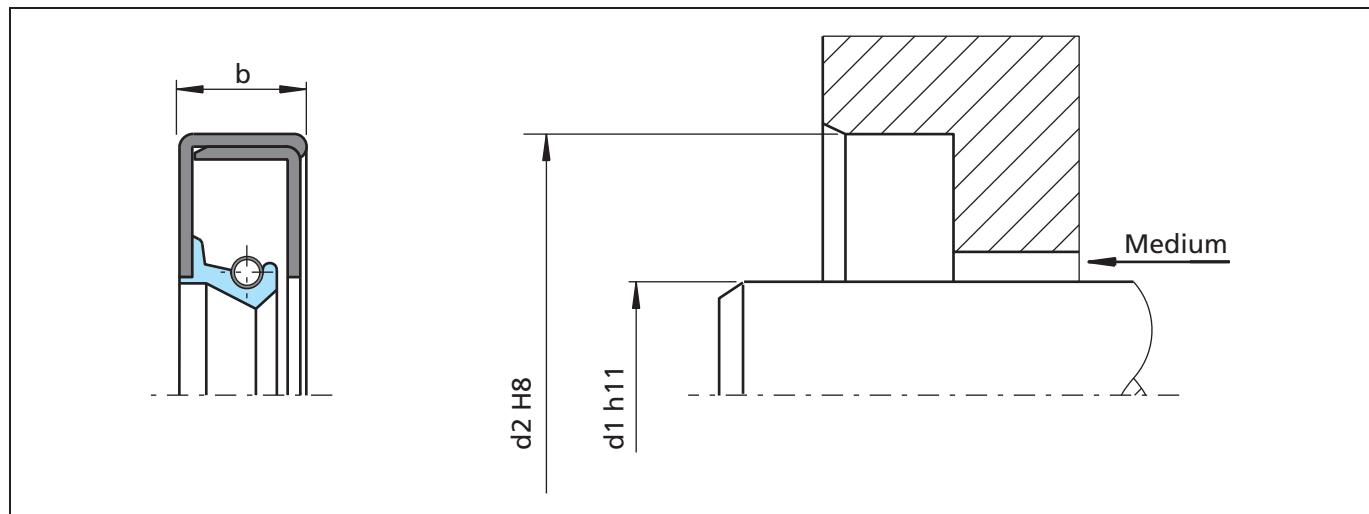

Figure 18 Installation drawing

### General description

Trelleborg Sealing Solutions type TRB are reinforced metal cased radial lip seals. The supplementary metal inner ring provides a superior stiffness. This type is not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

### Advantages

- Superior radial stiffness, especially for very large diameters
- Very good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications (e.g. mills in steel industry)

### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

**Table XIV Materials**

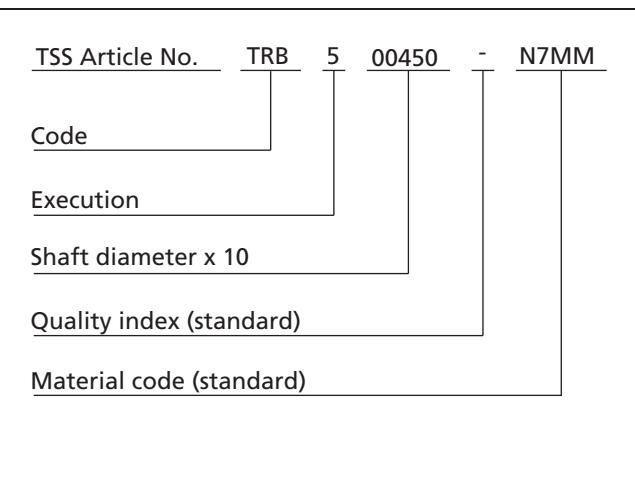

Standard material*	TSS material Code	Standard metal insert**	Standard spring**
NBR (70 Shore A)	N7MM	Carbon steel	Carbon steel
NBR (75 Shore A)	4N011		
FKM (70 Shore A)	VCBV	Carbon steel	Stainless steel
FKM (75 Shore A)	4V012		

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

**Ordering example oil seal TSS type**

TSS type: B  
 Code: TRB  
 Dimensions: Shaft diameter 45 mm  
 Housing diameter 60 mm  
 Width 10 mm  
 Material: NBR  
 Material Code: N7MM

## ■ Trelleborg Sealing Solutions type TRF

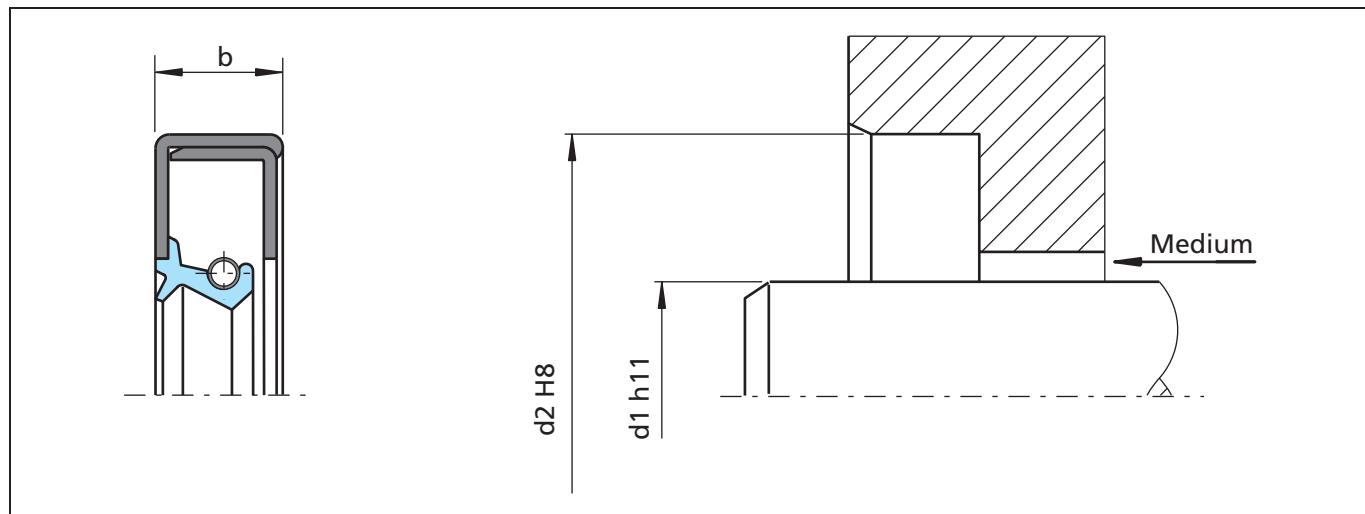

Figure 19 Installation drawing

### General description

Trelleborg Sealing Solutions type TRF are reinforced metal cased radial lip seals with dust lip. The supplementary metal inner ring provides a superior stiffness. This type is recommended for use in heavily polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with epoxy based resin O.D. coating. This special treatment is on request.

### Advantages

- Superior radial stiffness, especially for very large diameters
- Very good fitting stability avoiding pop-out of the seal
- Modern lip design provides low radial forces
- Cost effective
- Suitable for use in combination with axial seal (V-Ring and GAMMA-seal)

### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Electrical motors
- Machine tools
- Heavy engineering applications (e.g. mills in steel industry)

## Radial Oil Seal

### ■ Special types of rotary seals

When the seals designed according the standard of Figure 13, are not able to satisfy the application's specification, special seals are available. The selection guide in Table IV shows the range of seals suitable to fulfill the majority of

industrial applications and meeting DIN 3760/3761 requirements as well. Special seals include:

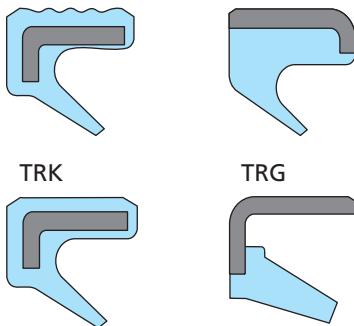

Types with half rubber OD:

TRD\_A

TRD\_B

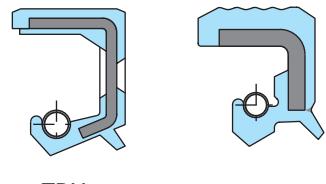

Rotary seals without spring:

TRK

TRG

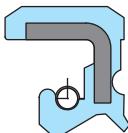

Types for medium pressure:

TRU

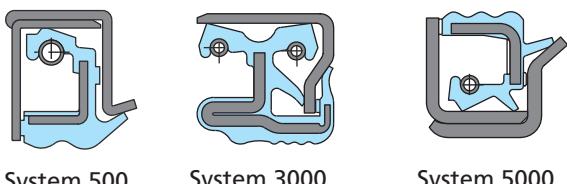

TRP

Types for medium-high pressure:

TRQ\_D

Cassette seals:

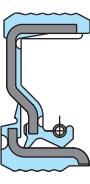

System 500

System 3000

System 5000

Combined seal:

APJ Seal

Figure 20 Selection of special radial seals

## ■ Trelleborg Sealing Solutions types TRD\_A / TRD\_B

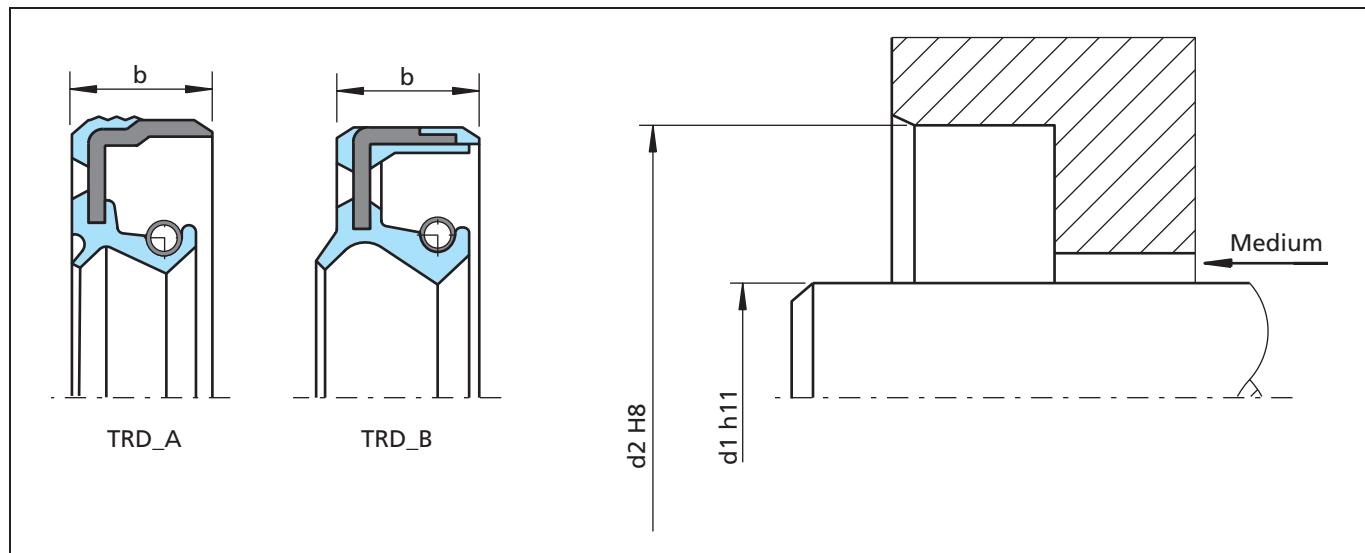

Figure 21 Installation drawing

### General description

Trelleborg Sealing Solutions types TRD\_A / TRD\_B are seals with partially rubber covered Outer Diameter. These seals are designed to assure a high assembly stiffness and a good static sealing together with a good heat transfer. The additional dust lip protects the main sealing lip against dust and other fine solid contaminants, therefore these types are recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied.

Please note that this O.D. design (half & half design) can be delivered on request also for different sealing lip types (e.g. type TRA, TRP, etc.)

### Advantages

- Good static sealing and stiffness (No pop-out effect)
- Good thermal expansion compensation
- Good heat transfer
- Effective protection against air side contaminants

### Application examples

- Automotive "Power-train" and "Drive-train"
- Automotive servo-pumps
- High speed transmission
- Machine tools

### Technical data

Pressure:	up to 0.05 MPa for standard lip profiles
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	up to 30 m/s (depending on material)
Media:	mineral and synthetic oils (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

**Table XVIII Materials**

Standard material*	TSS material code	Standard metal insert**	Standard spring**
NBR (70 Shore A)	N7MM	Carbon steel	Carbon steel
NBR (75 Shore A)	4N011		
FKM (70 Shore A)	VCBV	Carbon steel	Stainless steel
FKM (75 Shore A)	4V012		

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

Remark: These seals are customer tailored products.

For more details please contact your local Trelleborg Sealing Solutions marketing company.

## ■ Trelleborg Sealing Solutions type TRU - medium pressure oil seal

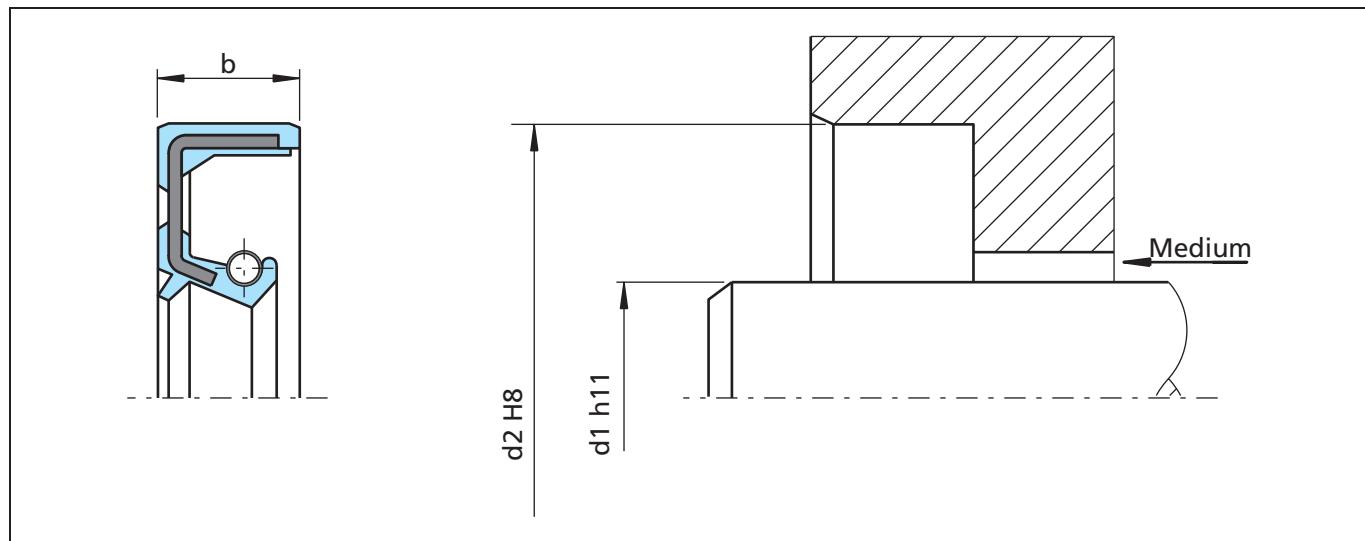

Figure 22 Installation drawing

### General description

Trelleborg Sealing Solutions type TRU is a seal with completely rubber covered outer diameter. This type of seal is designed with an extended metallic support of the diaphragm that allows pressures up to 0.5 MPa. In order to avoid a "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.). The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied.

### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 0.5 MPa pressure at moderate peripheral speed
- Effective protection against air side contaminants
- No need of back-up ring

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Hydraulic motors
- Machinery industry

### Technical data

Pressure:	up to 0.5 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 10 m/s (depending on pressure and material)
Media:	mineral and synthetic lubricants (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## ■ Trelleborg Sealing Solutions type TRP - medium pressure oil seal

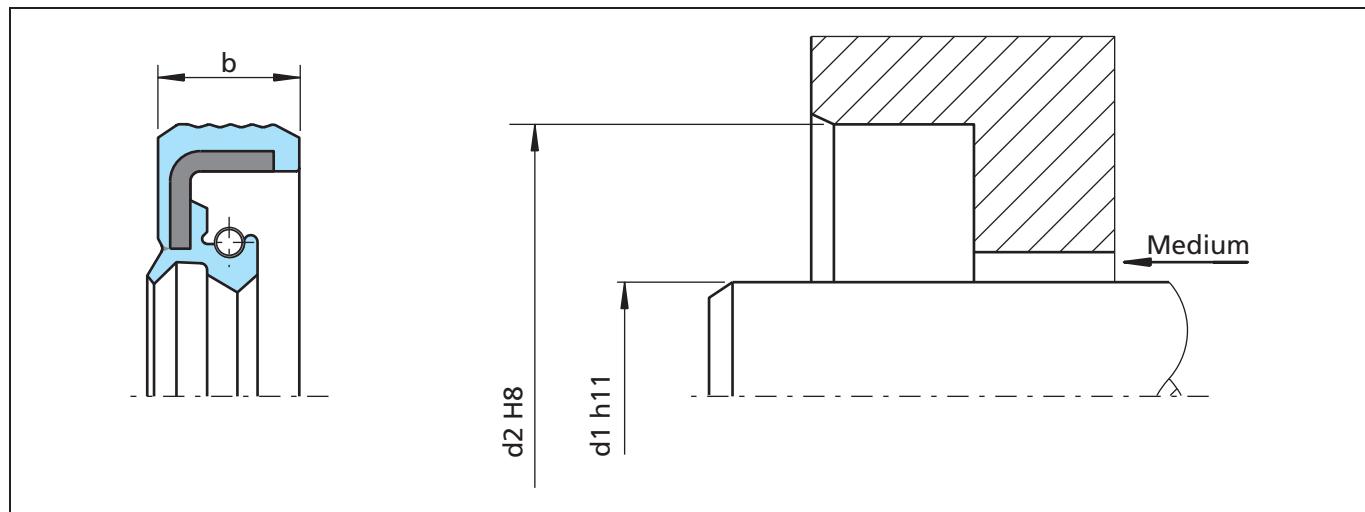

Figure 23 Installation drawing

### General description

Trelleborg Sealing Solutions type TRP are seals with completely rubber covered Outer Diameter. This type of seal is designed for pressures up to 0.5 MPa. In order to avoid a "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.) The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied.

### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 0.5 MPa pressure at moderate peripheral speed
- Low lip and shaft wear at low pressure run
- Effective protection against air side contaminants
- No need of back-up ring

### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Hydraulic motors
- Machinery industry

### Technical data

Pressure:	up to 0.5 MPa
Temperature:	-40 °C to +200 °C (depending on material)

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRQ - medium - high pressure oil seal

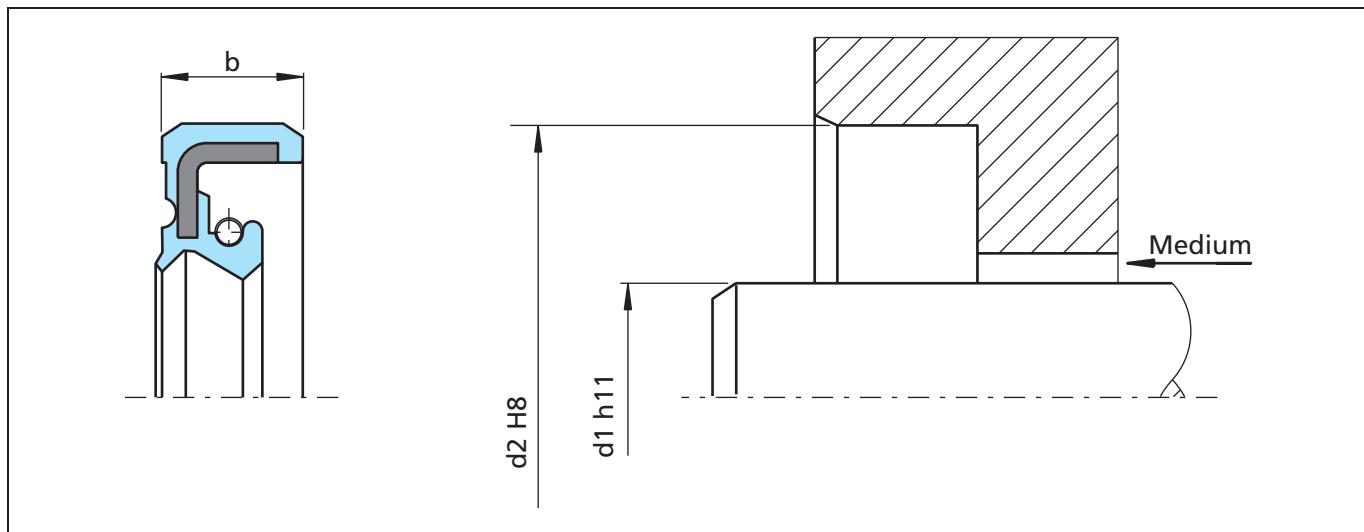

Figure 24 Installation drawing

#### General description

STEFA type 12 CC (TRQ\_D) is a seal with completely rubber covered Outer Diameter. This type of seal is designed for pressures up to 1 MPa. In order to avoid a "pop-out" of the seal, we suggest to fit an axial retainer (e.g. circlip, shoulder, etc.). The additional dust lip protects the main sealing lip against dust and other fine solid contaminants and therefore this type is recommended for use in polluted environments. To achieve a long lifetime a suitable lubricant between the two sealing lips should be applied.

#### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Reduced risk of fretting corrosion
- Up to 1 MPa pressure at low peripheral speed
- Effective protection against air side contaminants
- No need of back-up ring.

#### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Hydraulic motors
- Machinery industry

#### Technical data

Pressure:	up to 1 MPa
Temperature:	-40°C to +200°C (depending on material)

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRK

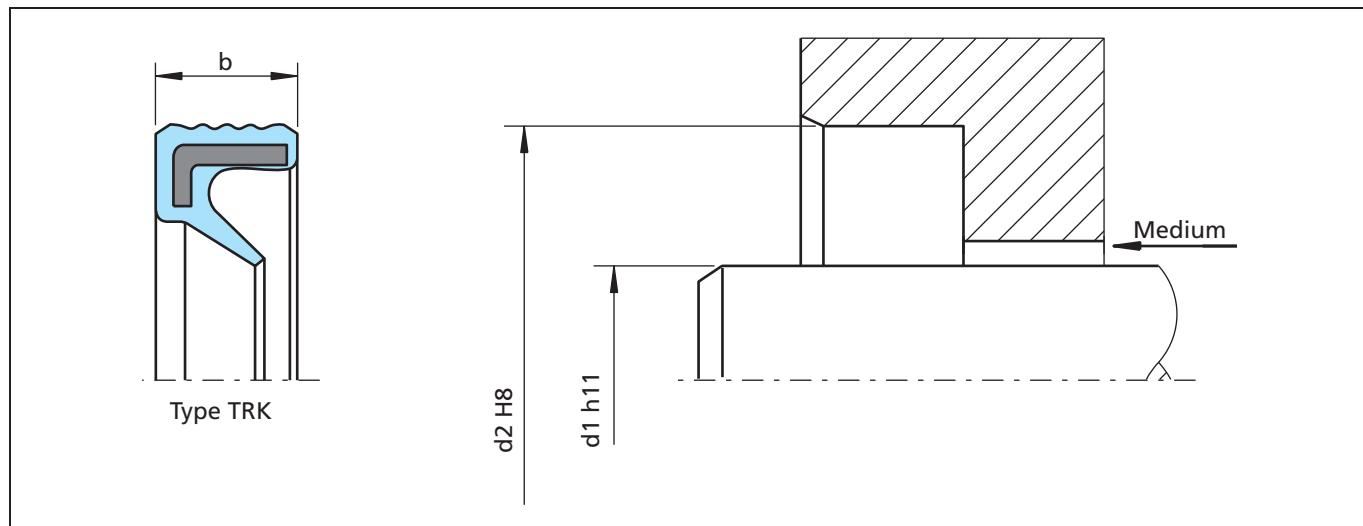

Figure 25 Installation drawing

#### General description

The Trelleborg Sealing Solutions type TRK are specially designed radial oil seals reinforced with a metal insert but without spring energized sealing lip and a wavy rubber covered outer diameter. STEFA CD type are available with flat rubber covered O.D. These types are not recommended for use in heavily polluted environments.

#### Advantages

- Good static sealing and thermal expansion compensation
- Low friction and low heat generation
- Extremely compact design
- Low radial force provides a low break-out torque
- Suitable for scraper applications

#### Application examples

- Roller bearings
- Tooling fixtures (e.g. drilling machines)
- Sealing against viscous media (e.g. grease)
- Supplementary excluders (shaft ends)
- Axle King Pin seals

#### Technical data

Pressure:	Without pressure
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 10 m/s
Media:	mineral and synthetic base greases

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRG

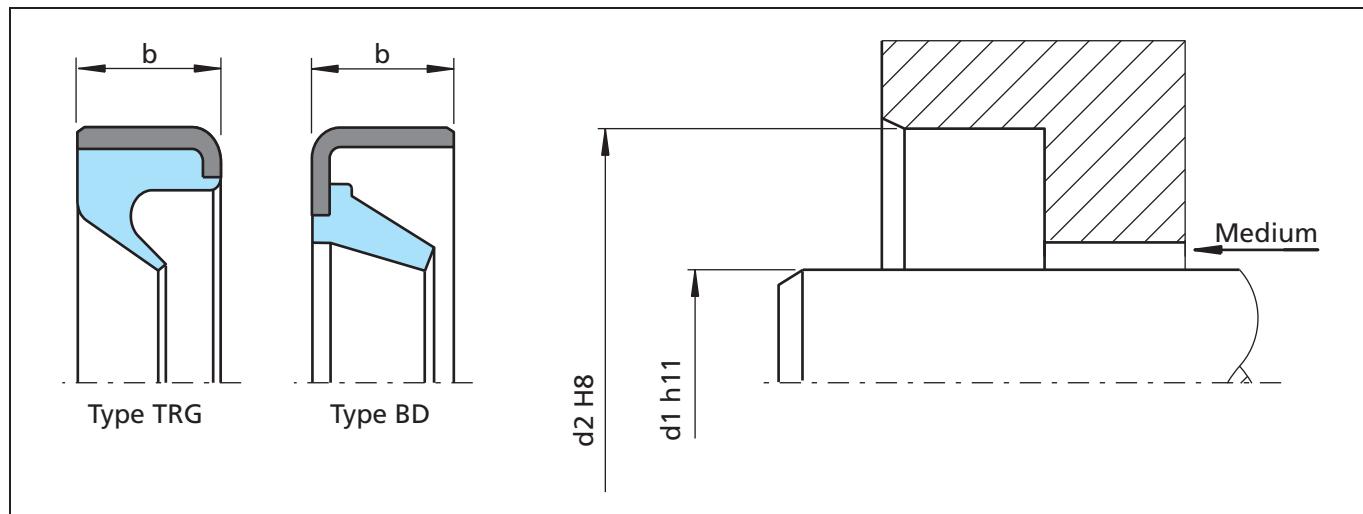

Figure 26 Installation drawing

#### General description

The Trelleborg Sealing Solutions type TRG and STEFA type BD are special metal cased radial oil seals without spring energized sealing lip. These types are not recommended for use in heavily polluted environments. As the static sealing between housing and metallic shell is limited, low viscosity media can "creep". Better performance can be achieved with Epoxy based resin O.D. coating. This special treatment is on request.

#### Advantages

- Good radial stiffness
- Good fitting stability avoiding pop-out of the seal
- Low friction and low heat generation
- Extremely compact design
- Low radial force provides a low break-out torque
- Suitable for scraper applications

#### Application examples

- Roller bearings
- Tooling fixtures (e.g. drilling machines)
- Sealing against viscous media (e.g. grease)
- Supplementary excluders (shaft ends)
- Axle King Pin seals

#### Technical data

- Pressure: without pressure  
Temperature: -40°C to +200°C (depending on material)  
Speed: up to 10 m/s  
Media: mineral and synthetic base greases

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

### ■ Rotary and axial seal combination

#### General Description

In many applications rotary shaft lip seals are used to seal against various media.

Lip seals often fail because of the destruction of the lubricant film, resulting in rapid wear, due to the ingress of dirt, dust, moisture etc. The use of shaft seals with one or more auxiliary sealing lips (dust lips) provides a limited improvement, but it is not always sufficient. In order to meet the constantly increasing sealing requirements, especially for the environmental protection and long service life the Trelleborg Sealing Solutions COMBI-seal is a simple solution. It has proved to be particularly well suited even in critical applications with heavy contamination. The COMBI-seal consists of a GAMMA seal and a rotary shaft lip seal working together. The lip seal provides the counterface for the GAMMA seal which is fixed to the shaft by press fit. See Figure 27 and 28.

Years of successful experiences show that another frequently used alternative consists in the combination of a V-Ring seal with a standard seal selected inside the type list: TRC; TRD; TRB; TRF.

The rotary shaft seal should be ordered "Without Markings" on the air side.

#### Radial Oil Seal + GAMMA seal

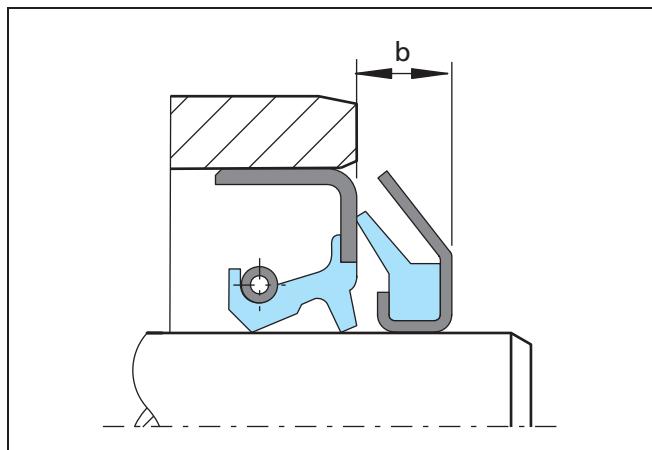

Figure 27 GAMMA seal fitted on the shaft end

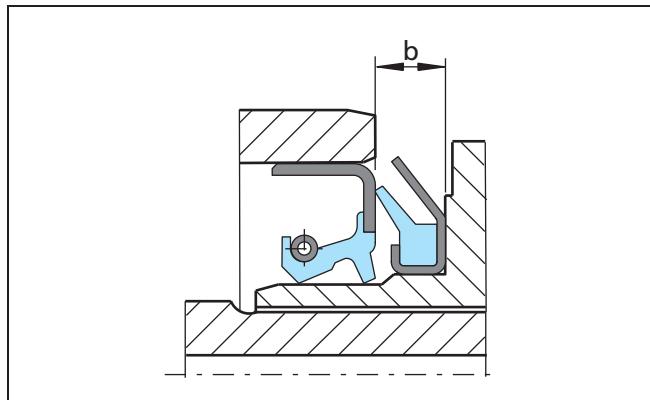

Figure 28 GAMMA seal fitted on the shaft boss

#### Radial Oil Seal + V-Ring

The function of the rotary axial seal is to prevent by centrifugation the intrusion of particles and water drops.

In other words, it adds its original protection capacity to the radial seal functionality. Sufficient space is required on the shaft to host the axial seal width. (See Figure 29).

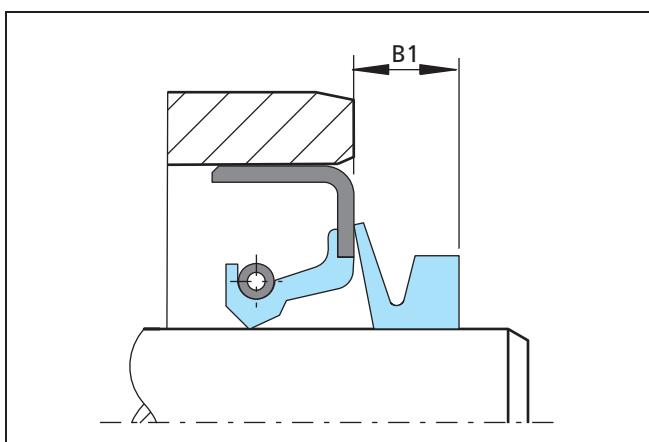

Figure 29 V-Ring fitted on the shaft end

#### Housing and shaft design

The radial lip seal needs to be assembled in the housing according to usual fitting instructions. Both V-Ring and GAMMA seal is assembled later on the shaft. The shaft design requires to be adapted by an elongation corresponding at least to B1 (b) dimension. In case of very high peripheral speeds, the V-Ring body should be radially supported. See also the instructions reported in the specific catalog chapter.

## Radial Oil Seal

The GAMMA seal can be fitted according above sequence but sometimes the shaft surface must be slightly changed in order to avoid scratches at assembly that can negatively influence the radial seal functionality (See Figure 27 and 28). See also the instructions in specific catalog chapters.

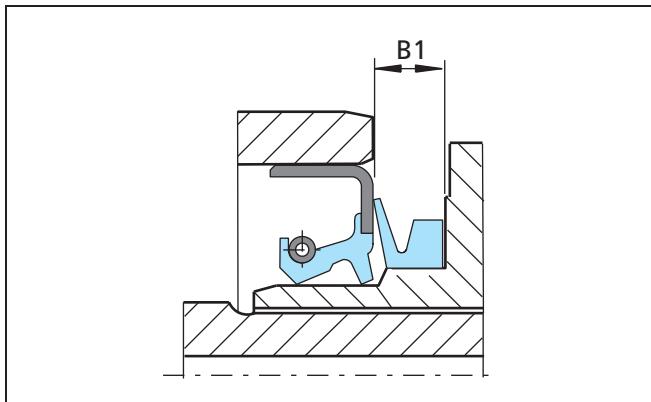

Figure 30 V-Ring type A fitted on the shaft boss

In the examples the V-Ring "type A" is represented, but any other type of V-Ring is usable in accordance with space available and application requirements.

In special application conditions, with design alterations in the housing, it is also possible the use of TRB type (labyrinth formed by metal shell and housing).

# Radial Oil Seal

## ■ Product description

The combination of Radial shaft seal with V-Ring or GAMMA seals is recommended for use in heavily polluted environments.

Both the radial shaft seal and the GAMMA seal housing may also be manufactured with different metal shell as well as different rubber types for sealing elements. See specific paragraphs.

### Advantages

- Longer service life and high function reliability
- Good IP protection for electrical motors (VDE-Norm 0470-1)
- Good protection against water splash and welding sparks
- Simple handling
- Superior total economy
- Friction loss decreases with increasing shaft speed

### Application examples

Typical applications are all equipment working in contaminated environments where dust, foreign matter and liquid splatter are present.

Some examples:

- gear motors
- journal and gear transmissions
- bearing housings
- power saws
- utility vehicles
- agricultural machinery and equipment
- wheel hubs
- propeller shafts
- pumps
- hydraulic motors
- tool machinery
- equipment for steel manufacturing
- metal working machinery

### Technical data

Pressure:	see radial seal data
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	up to 20 m/s (depending on material)
Mediums:	Mineral and synthetic oils (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

### Materials

See specific chapters.

### Ordering example

Order components separately as per specific chapters.  
Order the radial oil seals "**without marking**".

## ■ Combined rotary shaft seal

### General description

The combined rotary shaft lip seal is an assembly which includes a supplementary protection of the radial sealing elements with an axial rotary sealing lip integrated into a wear sleeve. The rubberized wear sleeve and radial seal are designed to satisfy both customer's and DIN 3760 (3761) specifications.

### Sealing lips design

The sealing lip's design corresponds to the latest state of development based on many years of laboratory and field tests. The main radial sealing edge can either be ready molded (when equipped with TURBO ribs) or trimmed by mechanical cutting. The total radial force of the sealing lip is extremely low thanks to the miniaturization of the lip profile and the application of smallest possible Garter spring. The above miniaturization is made in order to reduce as much as possible the metal sleeve wear, the friction loss and relevant heat generation.

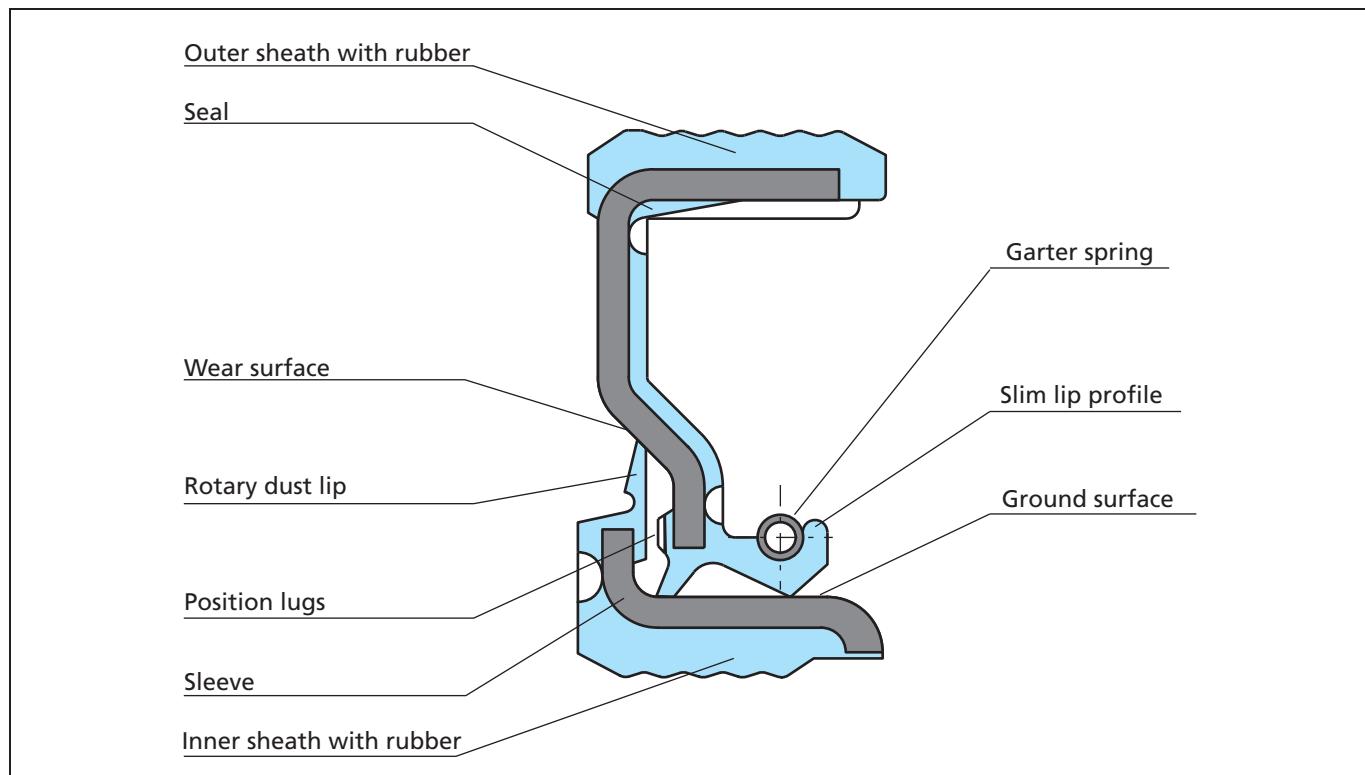

Figure 31 APJ seal details

## Radial Oil Seal

### ■ STEFA standard APJ type

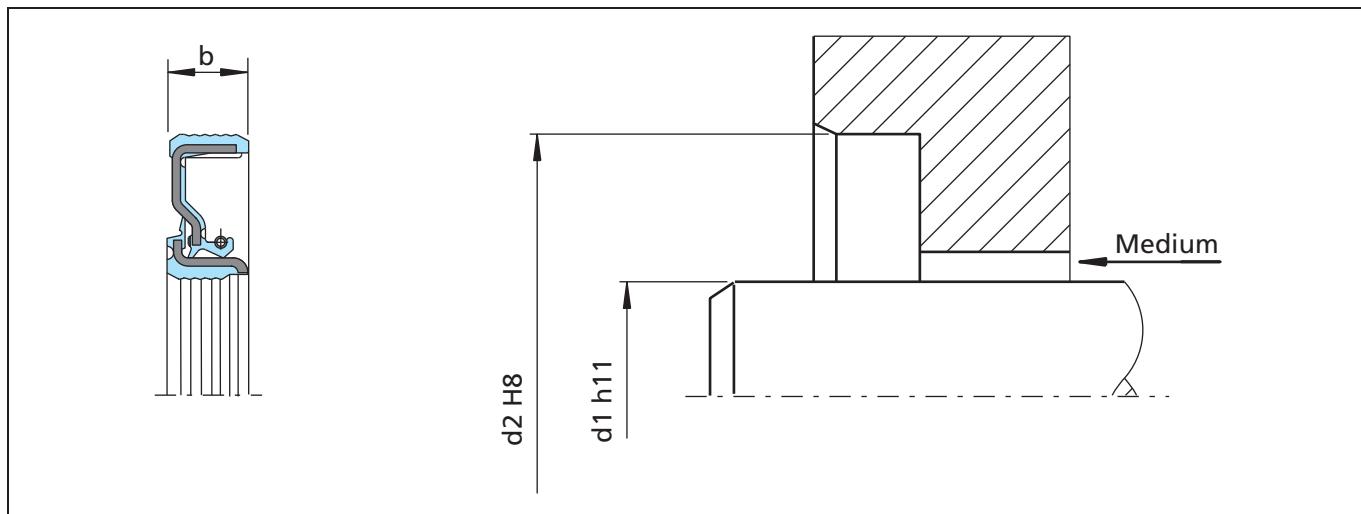

Figure 32 Installation drawing

#### Product description

STEFA standard APJ is a seal with completely rubber covered outer diameter. Two different O.D designs are available: Flat rubber sheath as well as wavy, both correctly fitting into H8 bores.

APJ seal is recommended for use in heavily polluted environments.

Both the seal and the sleeve may also be manufactured with different metal insert material as well as different rubber types.

#### Advantages

- Good static sealing
- Compensation of different thermal expansion
- No risk of fretting corrosion
- Higher bore surface roughness is allowed
- Do not require shaft hardening
- Do not require shaft grinding
- Modern lip design provides low power loss

#### Application examples

- Transmission systems (e.g. gearboxes)
- Pumps
- Washing machines
- Machinery for Industry (e.g. tool machines)
- Axles for heavy-duty applications

#### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40 °C to +200 °C (depending on material)
Speed:	up to 10 m/s (depending on material)
Media:	mineral and synthetic oils (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

The above data are maximum values and cannot be used at the same time, e. g. the maximum operating speed depends on material type, pressure and temperature.

## Radial Oil Seal

**Table XIX Materials**

Standard material*	TSS material code	Standard metal insert**	Standard spring**
NBR (75 Shore A)	4N011	Carbon steel	Carbon steel
FKM (75 Shore A)	4V012	Carbon steel	Stainless steel

\* Special grades and other materials (ACM, EACM, EPDM, HNBR, VMQ) on request.

\*\* Metal insert, and spring as well, can be supplied in different materials on request.

Remark: These seals are customer tailored products.

Sealing Solutions marketing company.

## Radial Oil Seal

### ■ STEFA 1B/APJ and 2B/APJ types - housing as per DIN 3760-3761

The design of the radial seal corresponds to STEFA Type 1B/CC and 2B/CC.

The sleeve remains the same for all kind of radial seal design.

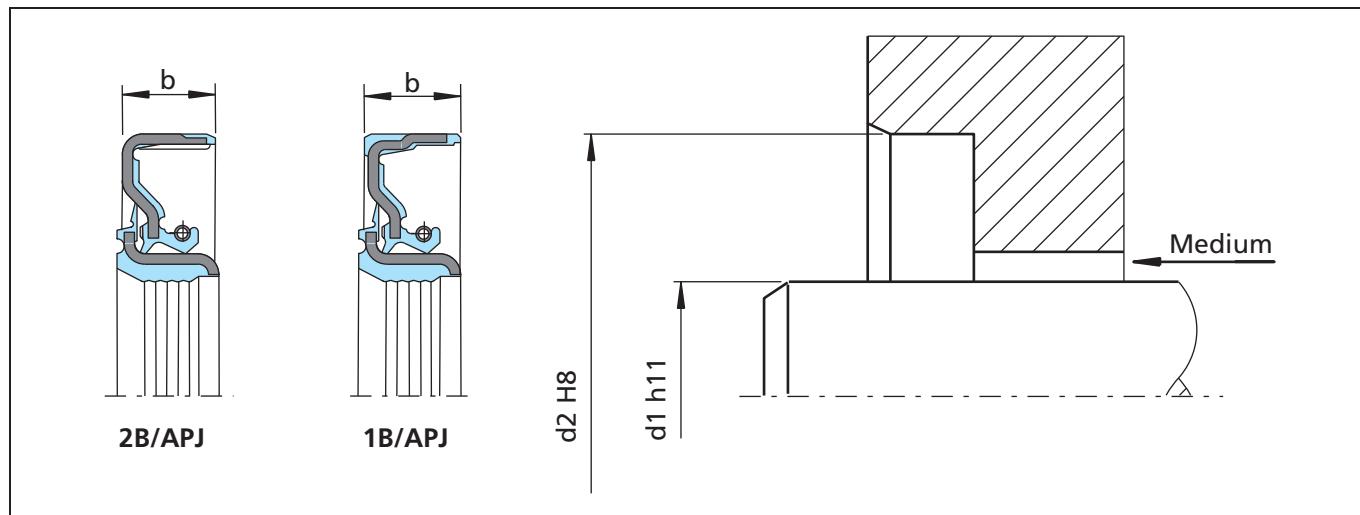

Figure 33 Installation drawing

#### Product description

STEFA 1B/APJ and 2B/APJ types are radial lip seals with partially rubber covered outer diameter.

1B/APJ type recommended for use in heavily polluted environments and where a good axial retention force is required with a good heat transfer as well. The type 2B/APJ is recommended for aluminum or soft metal housings that may be scratched at assembly by metal frame of the seal.

#### Advantages

- Good static sealing
- Compensation of different thermal expansion
- Higher bore surface roughness is allowed
- Do not require shaft treatment (hardening and grinding)
- Modern lip design provides low power loss
- Good heat transfer to outside
- Quick servicing (No shaft rework required)

#### Technical data

Pressure:	up to 0.05 MPa
Temperature:	-40°C to +200°C (depending on material)
Speed:	up to 10 m/s (depending on material)
Media:	mineral and synthetic oils (CLP, HLP, APGL etc.)

Trelleborg Sealing Solutions has carried out several thousands compatibility tests. Please ask for details.

#### Important Note:

## Radial Oil Seal

### ■ Trelleborg Sealing Solutions type TRJ/TRL

#### Fiber reinforced oil seals for large diameter

Fiber reinforced oil seals contain no metal parts with the exception of the spring. Instead of the metal insert, a reinforced fiber component is molded into the body of the seal. Damage through transport and mounting is consequently excluded.

Fiber reinforced oil seals are mainly used for installation in constructions and equipment with large diameters.

The use of an axial retaining plate is necessary except for the type TRJ/F and respectively for the type TRL/F.

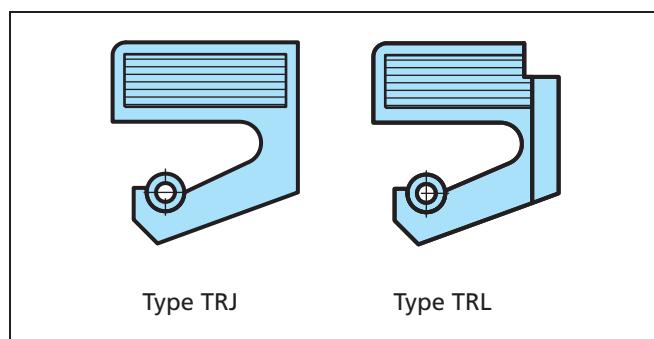

Figure 34 Fibers reinforced design for large diameters

#### Split version

To ease the mounting or in case of repair the types TRJ and TRL are also available in split version.

To ensure effective sealing at the split ends, a full rubber section is molded at the join so that contact between homogeneous elastic surfaces maximizes the sealing effect.

The interface should always be above the oil level.

If two seals in split version are mounted together, the interface should be turned a minimum of 30° to the side.

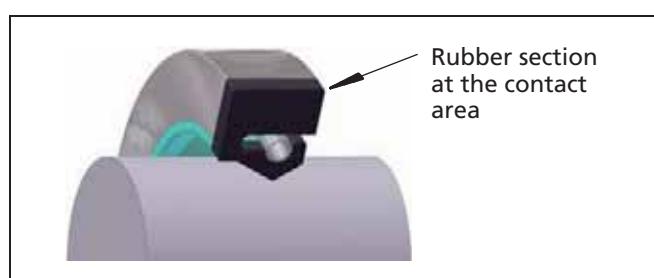

Figure 35 Contact area, split seal

#### Separation of two media with type TRL

A single oil seal should not be used for the separation of two Media.

In such cases two seals are fitted in a back to back arrangement. The type TRL is suitable for the sealing of large diameters. It is a special design with peripheral and radial grooves where a lubricant could be applied.

The peripheral groove on the seal reduces the need to cut a groove in the housing. See figure : Type TRL mounted back to back.

The seal can be used for:

- Isolation of two media
- If a lubrication is necessary from the outside

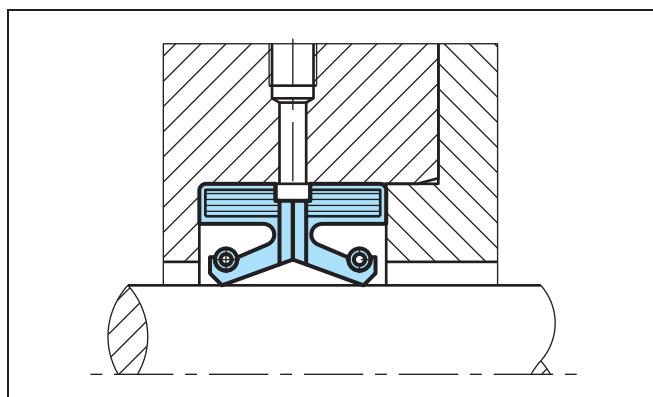

Figure 36 Type TRL mounted back to back

#### Special design TRJ/F and TRL/F with reinforced shoulder

Whenever a retaining plate cannot be fitted we can supply a seal made in a special hardened compound namely type TRJ/F and TRL/L, which makes the seal self-retaining and providing effective sealing also at the O.D.

Trelleborg Sealing Solutions type TRJ/F and TRL/F are supplied in standard form and are not available in split version. See figure 37.

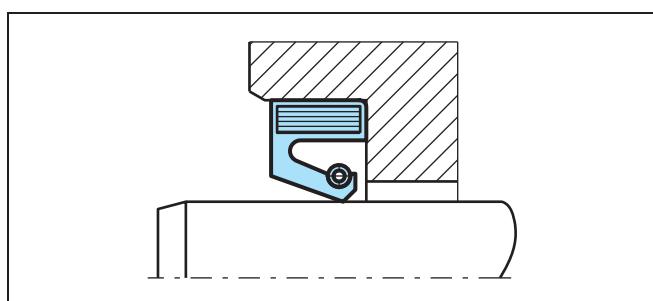

Figure 37 Type TRJ/F mounted without axial retaining plate

## ■ Design Instructions

### Installation on the shaft

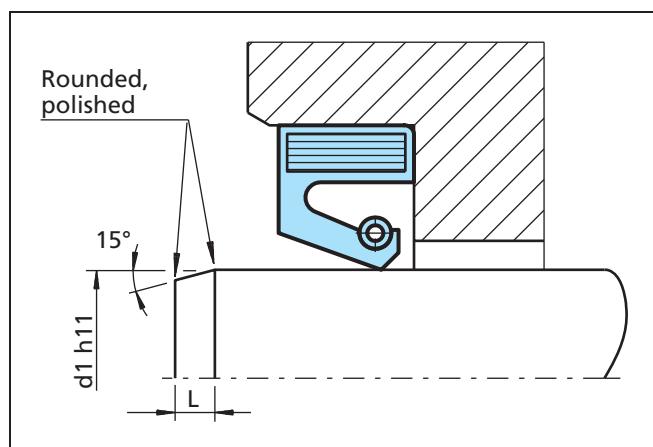

Figure 38 Installation of the oil seal

To facilitate the installation of the seal with minimum risk of lip damage, the shaft have a 15° chamfer with length "L" as function of its diameter "d<sub>1</sub>".

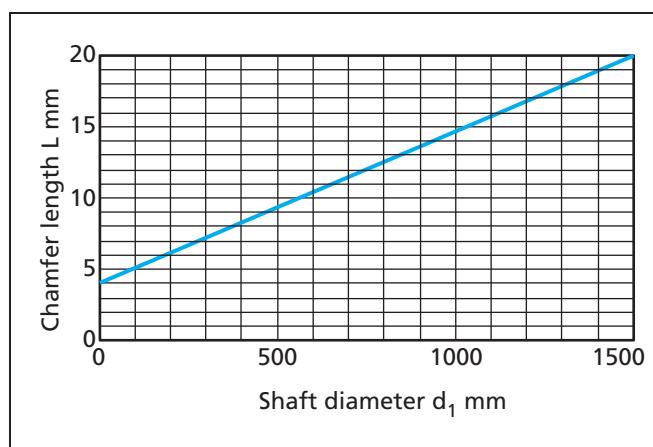

Figure 39 Chamfer length as function of the shaft diameter

### Eccentricity

Eccentricity between shaft and housing bore centers should be avoided in order to eliminate unilateral load of the lip.

**Table XXXI Static Eccentricity**

d <sub>1</sub>	b x f (mm)	max. stat. Ecc. (mm)
100 - 250	16 x 20	0.50
250 - 400	20 x 22	0.55
400 - 600	22 x 25	0.62
>600	25 x 32	0.70

### Shaft run out

Shaft run out should be avoided or kept within a minimum. At higher speeds there is a risk that the inertia of the sealing lip prevents it from following the shaft movement. The seal must be located next to the bearing and the bearing play be maintained at the minimum value possible.

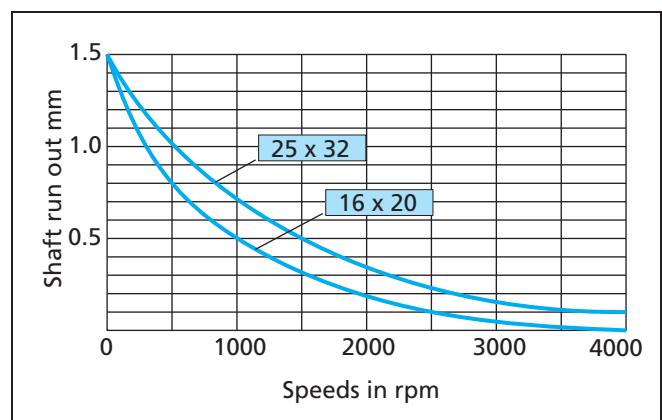

Figure 40 Shaft run out

### Installation in the gland

The static seal in the mounting bore is provided by the corresponding force fit allowance at the outer sheath of the seal.

The bore tolerance is specified to DIN ISO 286T2-H8.

Values for the surface roughness in the gland are specified in ISO 6194/1.

General values:

R <sub>a</sub>	= 1.6 - 6.3 µm
R <sub>z</sub>	= 10 - 20 µm
R <sub>max</sub>	= 16 - 25 µm

For gas sealing, a good score-free and spiral-free surface finish is necessary. If the rotary shaft lip seal is bonded into the housing, ensure that no adhesive comes into contact with the sealing lip or the shaft.

The bore d<sub>2</sub> of the sealing housing indicated in table XXXI as function of shaft diameter. ( $d_2 = d_1 + 2 \times f$ ). See page 116.

The width(b) including the tolerance is also given in table XXXII.

## Radial Oil Seal

### ■ Installation, Type TRJ

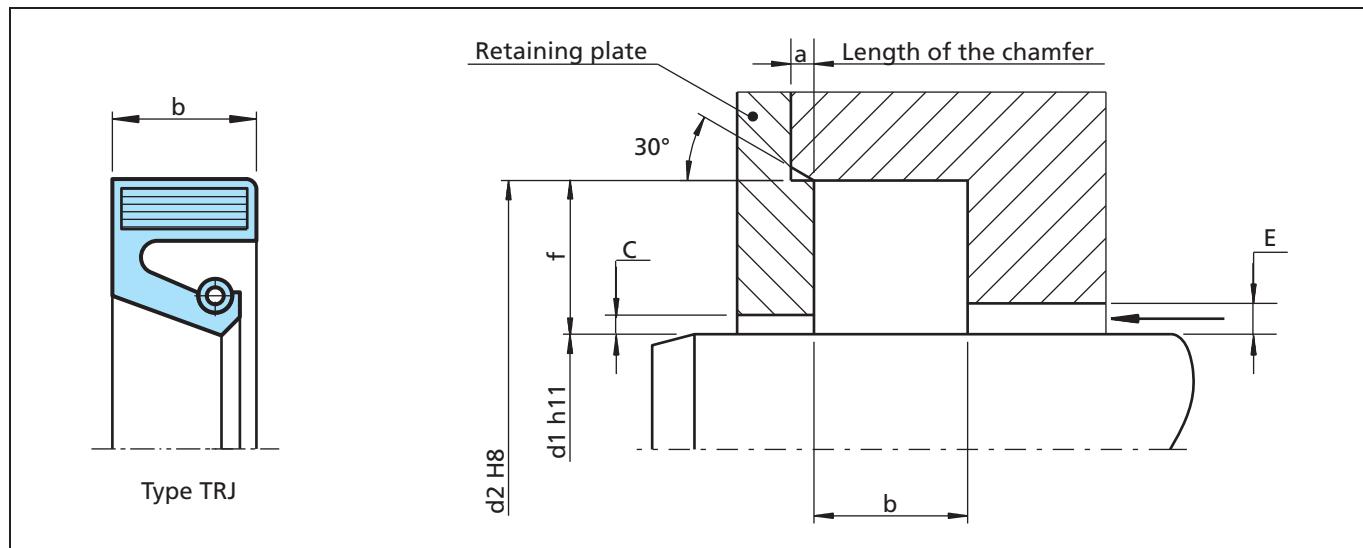

Figure 41 Installation drawing

### ■ Installation, Type TRL

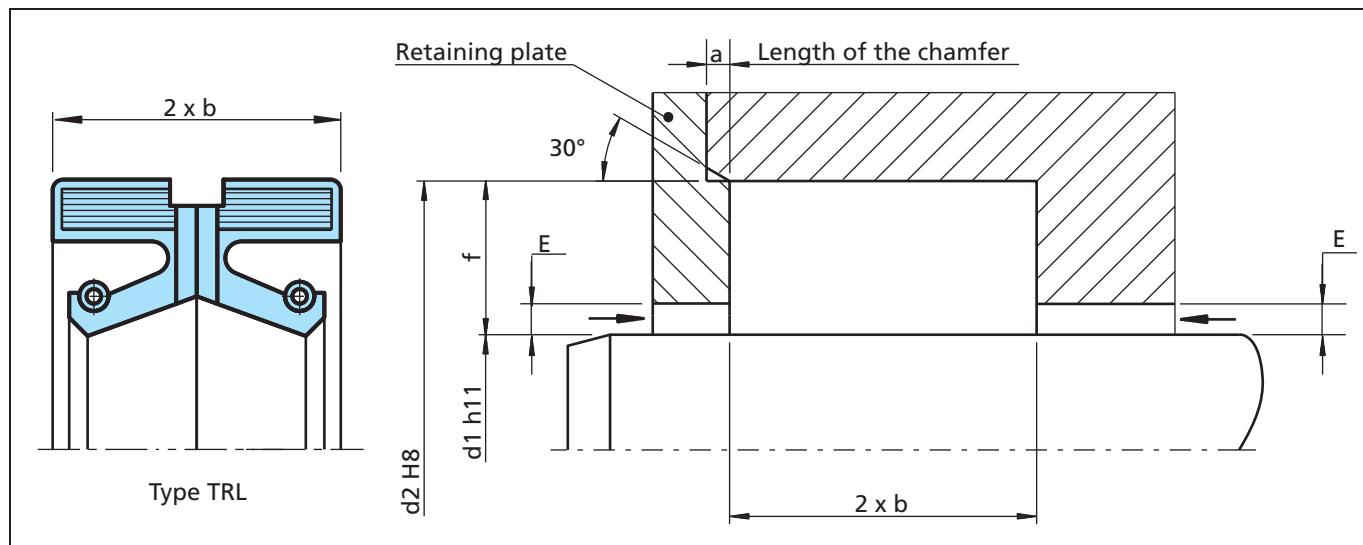

Figure 42 Installation drawing

**Table XXXII Dimensions**

<b>d1</b>	<b>b x f</b>	<b>a</b>	<b>E</b>	<b>C</b>	<b>b</b>
100 - 250	16 x 20	2.0	9	4	$16 \pm 0.1$
250 - 400	20 x 22	2.2	11	6	$20 \pm 0.2$
400 - 600	22 x 25	2.5	11	7	$22 \pm 0.2$
>600	25 x 32	3.2	14	8	$25 \pm 0.2$

## ■ Technical Data, Type TRJ and TRL\*

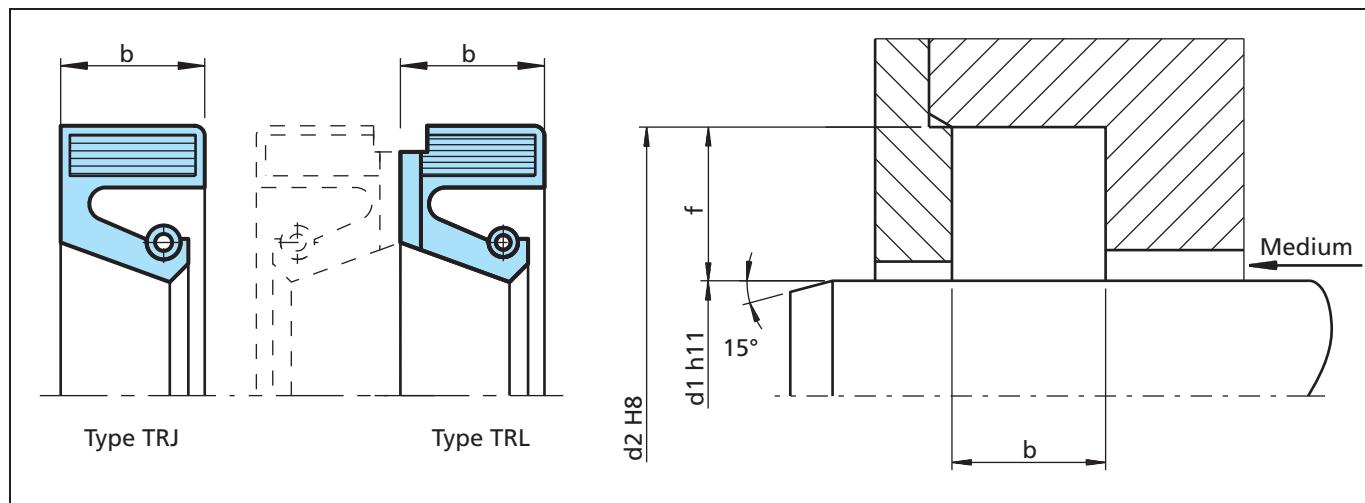

Figure 43 Installation drawing

**Table XXXIII Material**

Standard-material*	TSS Material code	Standard-spring*
NBR (75 Shore A)	4NC01	Carbon steel
HNBR (75 Shore A)	4HC01	Carbon steel
FKM (75 Shore A)	4VC02	Stainless steel

\* The spring can be supplied in different materials on request.

**Table XXXIV Technical Data**

Type	Temperature	Speed	Pressure	Dimensions
TRJ	-30°C to +200°C	up to 25 m/s	0.05 MPa	100 - 1890
TRL	-30°C to +200°C	up to 25 m/s	0.05 MPa	100 - 1890
